1. Churn Analysis Introduction

In today's competitive corporate environment, customer retention is critical to long-term success. One important method for comprehending and lowering this client attrition is churn analysis. It entails looking at customer data to find trends and explanations for why customers leave. Businesses may identify which clients are most likely to leave and comprehend the variables influencing their choices by utilizing machine learning and advanced data analytics. With this information, businesses may take proactive measures to increase client loyalty and happiness.

1.1. Who is the Target Audience?

The methods and insights used in this research are applicable to a variety of businesses, even though it concentrates on churn analysis for a telecom company. This Churn research is useful for any company that values keeping customers, from retail and banking to healthcare and beyond. I will examine the strategies, resources, and best practices for enhancing customer loyalty and lowering attrition while turning data into useful insights for long-term success.

1.2. My Project Goal

To use the customer data and accomplish the following objectives, I will create a complete ETL process in a database and a Power BI dashboard:

- Analyze and visualize customer data at the following levels.
- Services for Demographic and Geographic
- Payment and Account Information

- Examine the Churner Profile and
- Determine Where Marketing Campaigns Should Be Implemented
- Find a Way to Forecast Upcoming Churners

1.3. Metrics Needed

- Total Clients
- Total Churn
- Churn Rate for New Hires

2. SQL Server ETL Process

Step 1

The first step in analyzing churn involves importing the data from my source file. I will be utilizing Microsoft SQL Server for this, as it is a popular solution in the industry and offers superior capability in managing recurring data loads and ensuring data integrity compared to an Excel file.

2.1 Download SSMS

To execute our SQL queries, Microsoft offers a graphical user interface called SQL Server Management Studio. You can obtain the latest version from the link provided below.

<https://learn.microsoft.com/en-us/sql/ssms/download-sql-server-management-studio-ssms?view=sql-server-ver16>

Download SSMS

[Download SQL Server Management Studio \(SSMS\) 20.2.1](#)

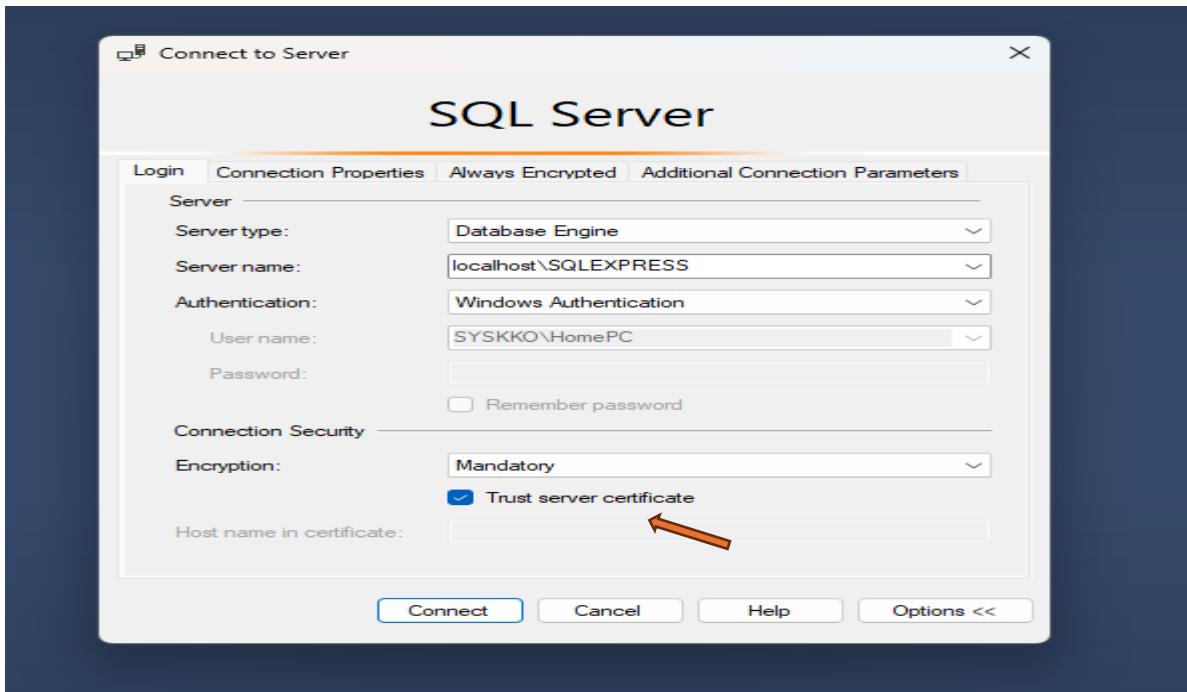

SSMS 20.2.1 is the latest generally available (GA) version. If you have a *preview* version of SSMS 20 installed, uninstall it before installing SSMS 20.2.1. Installing SSMS 20.2.1 doesn't upgrade or replace SSMS 19.x and earlier versions.

- Release number: 20.2.1
- Build number: 20.2.37.0
- Release date: April 8, 2025

2.2 Creating Database

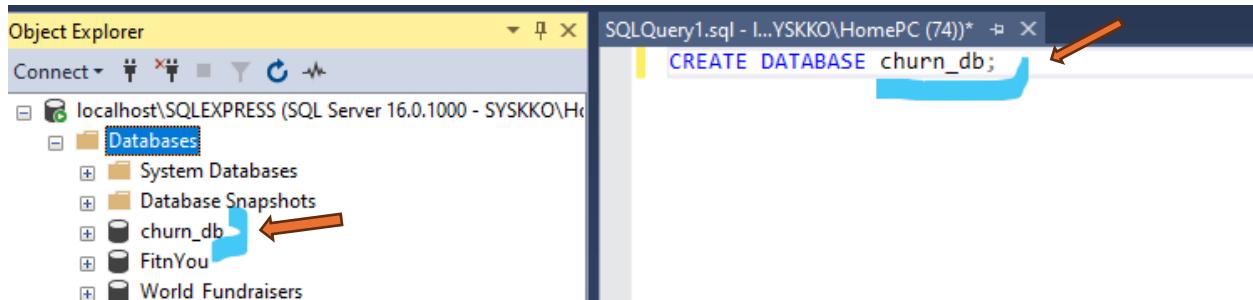

After completing the installation, I will be directed to the following screen. I made sure to copy and save the server's name somewhere, as it will be needed later. Additionally, I checked the box that says, "Trust Server Certificate," and then I clicked on Connect.

Once I was connected, I clicked on the NEW QUERY button located in the top ribbon and then entered the following query. This will create a new database named Churn_db

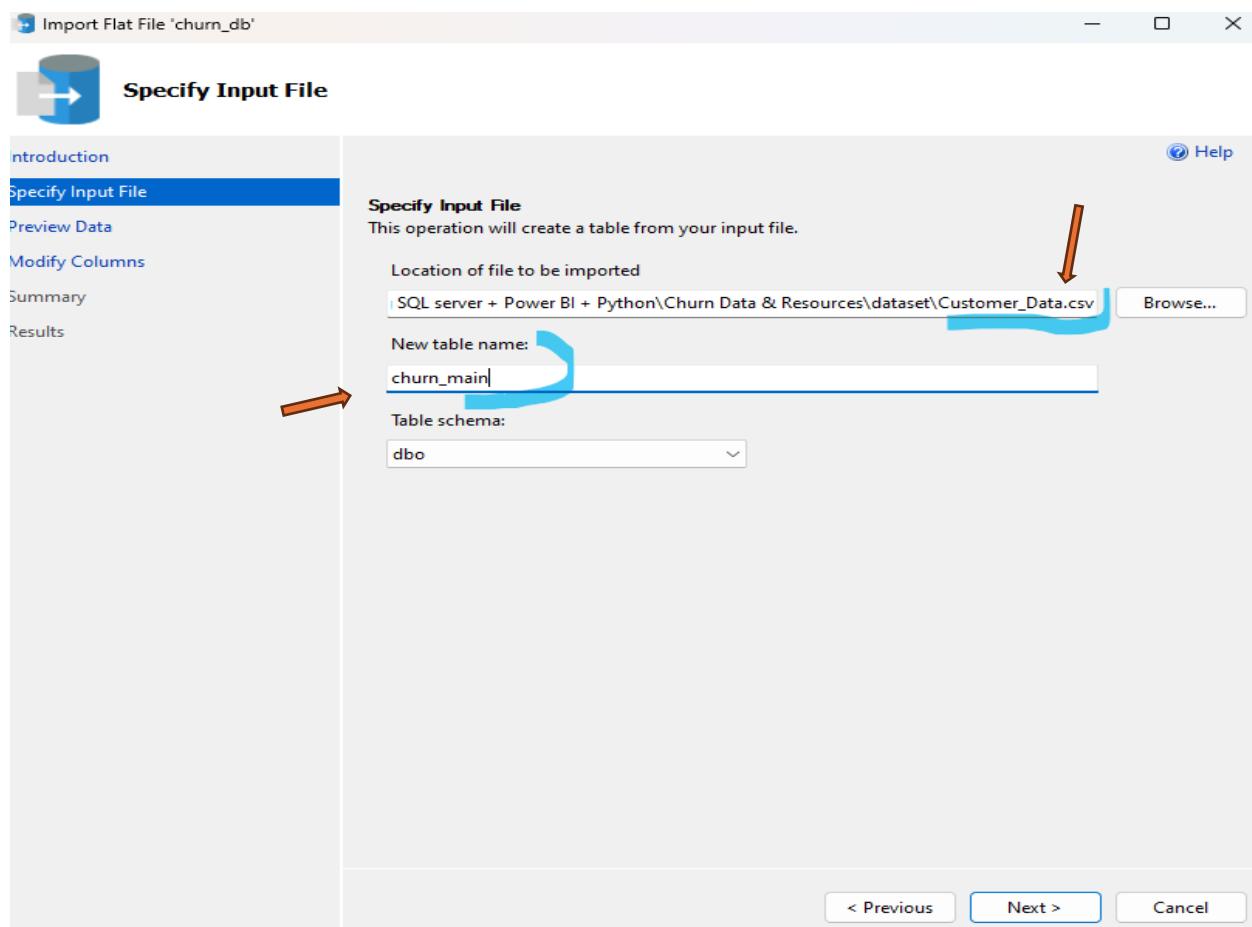

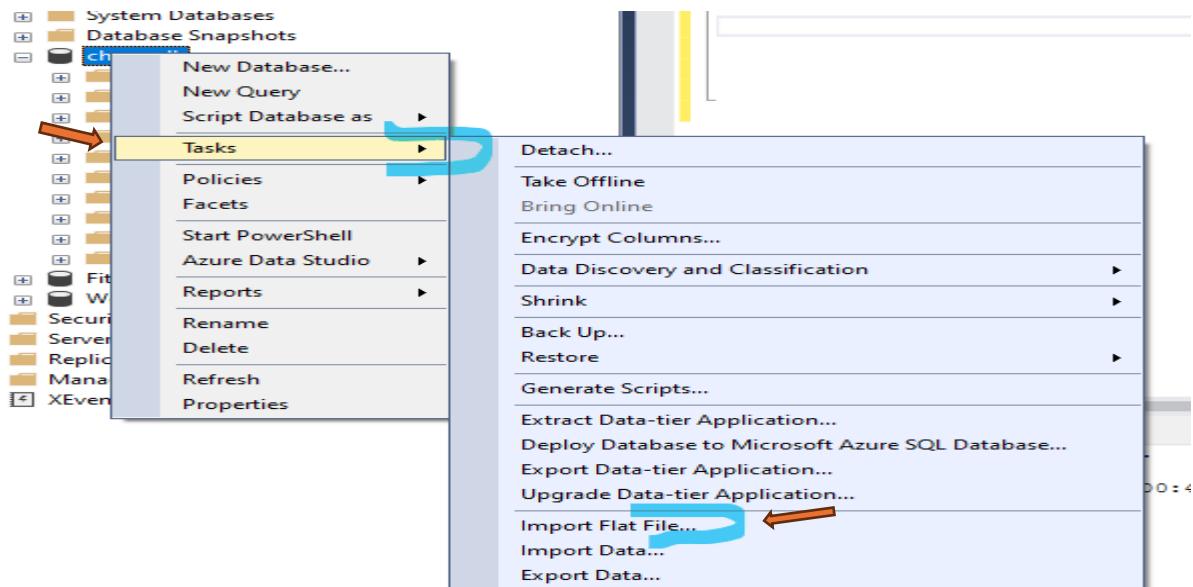

The steps to do from here are to:

- Creating a database
- Creating a Table
- Load The Data into the Table

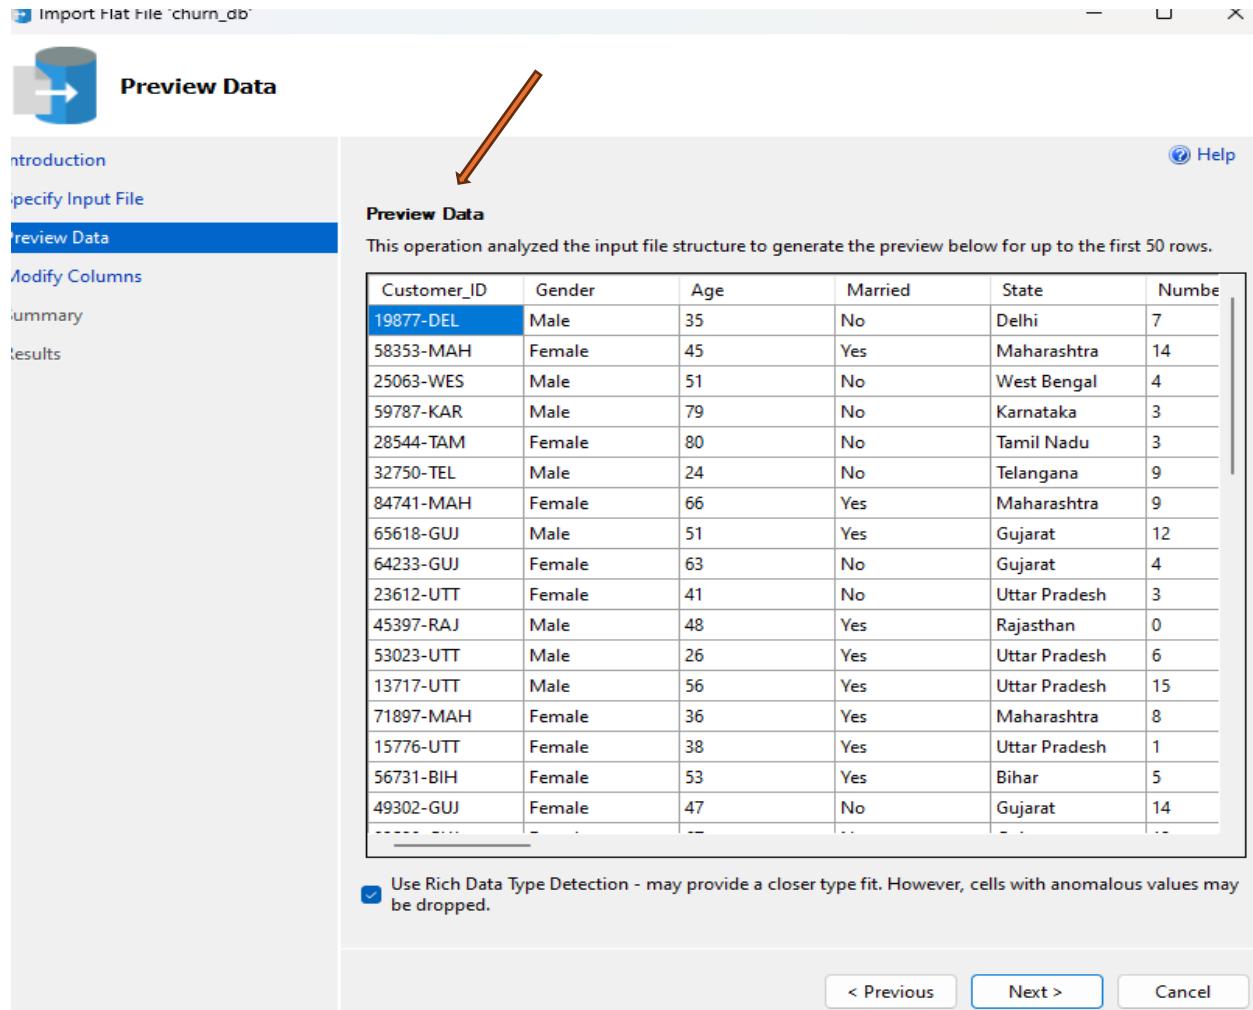

Now the database is shown on the left explorer panel.

To import a CSV file into a SQL Server staging table using the Import Wizard, I began by right-clicking on the newly created **churn_db** database in the explorer panel, then navigated to Task >> Import >> Flat file >> Browse for the CSV file called **Customer_Data**. It's important that I set **customerId** as the primary key and permit null values for all other columns to prevent any data load errors. Additionally, ensure that I modify the data type from **Bit** to **Varchar(50)**. This change is necessary because I encountered issues with the **BIT** data type while using the import wizard, whereas **Varchar (50)** worked without problems.

The dbo means database owner which is the default database/schema of the SQL SERVER.

Import Flat File 'churn_db'

Modify Columns
Summary
Results

Modify Columns
This operation generated the following table schema. Please verify if schema is accurate, and if not, please make any changes.

Column Name	Data Type	Primary Key	Allow Nulls
Customer_ID	nvarchar(50)	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Gender	nvarchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Age	tinyint	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Married	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
State	nvarchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Number_of_Referrals	tinyint	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Tenure_in_Months	tinyint	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Value_Deal	nvarchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Phone_Service	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Multiple_Lines	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Internet_Service	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Internet_Type	nvarchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Online_Security	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Online_Backup	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Device_Protection_Plan	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Premium_Support	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Streaming_TV	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Streaming_Movies	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Streaming_Music	varchar(50)	<input type="checkbox"/>	<input checked="" type="checkbox"/>

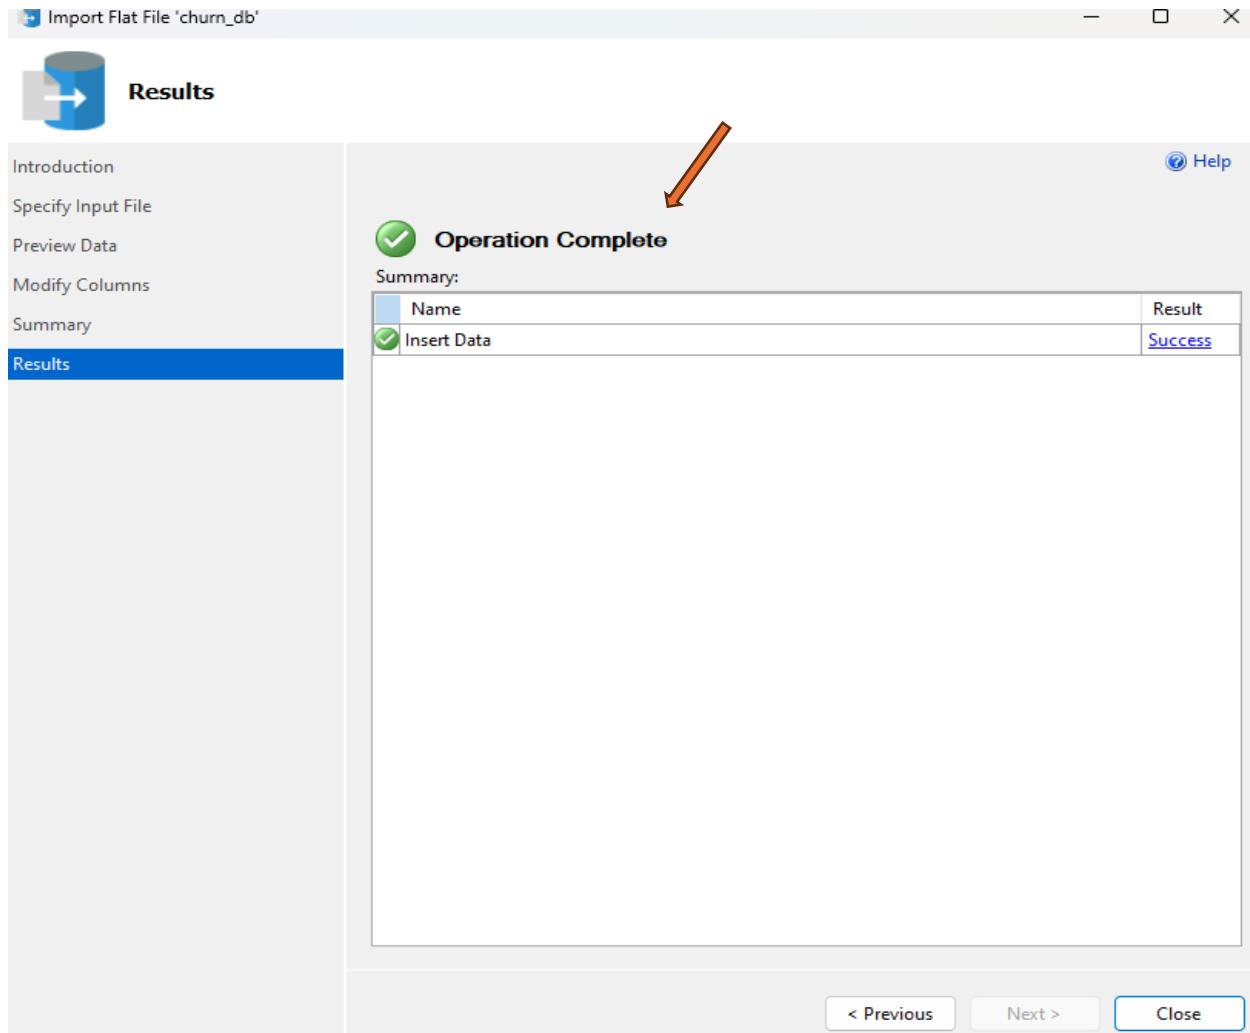

Row granularity of error reporting (performance impact with smaller ranges)

< Previous Cancel

Now this Modify column is where I modified my **Datatype**, **Primary key**, **Null values**, is important because with the wrong placement of datatypes, the data will not load, and it will show an error.

So, I changed all datatypes showing **bits** to **varchar(50)** and I ticked the box for **Customer_ID** to be the **primary key** and I unchecked Allow Null for **Customer_ID** because originally all **unique identifiers** shouldn't have **Null values**.

Finally, it got Imported and Operation successful.

This screenshot shows the SQL Server Management Studio interface. On the left, the 'Object Explorer' shows a tree view of databases. Under 'localhost\SQLEXPRESS (SQL Server 16.0.1000 - SYSKKO\HomePC)', the 'Databases' node is expanded, showing 'System Databases', 'Database Snapshots', and 'churn_db'. The 'churn_db' node is selected and highlighted in blue. An orange arrow points from the text above to this highlighted node. To the right, the 'SQLQuery1.sql' window is open, displaying T-SQL code for creating the database. The code is as follows:

```
-- Creating The churn_db Database
CREATE DATABASE churn_db;
```

Now the table has appeared on the **explorer panel**.

2.3. Data Exploration – Checking for Distinct Values

First, I had to check the **columns** to see that everything was alright and understand the **distribution of data**.

```
-- Creating The churn_db Database and Importing Data
CREATE DATABASE churn_db;

-- Checking the data
USE churn_db; -- This is the database
SELECT *
FROM churn_main
```

Customer_ID	Gender	Age	Married	State	Number_of_Referrals	Tenure_in_Months	Value_Deal	Phone_Service	Multiple_Lines	Internet_Service	Internet_Type	Online_Security	Online_Backup	Device_Protection_Plan	Premium_Support	Streaming_TV	Streaming_Music	
1	11098-MAD	Female	30	Yes	Madhya Pradesh	0	31	Deal 1	Yes	No	Yes	Fiber Optic	Yes	Yes	No	Yes	No	Yes
2	11114-PUN	Male	51	No	Punjab	5	9	Deal 5	Yes	No	Yes	DSL	No	No	Yes	No	No	No
3	11167-WES	Female	43	Yes	West Bengal	3	28	Deal 1	Yes	Yes	Yes	Fiber Optic	Yes	Yes	Yes	Yes	Yes	Yes
4	11179-MAH	Male	35	No	Maharashtra	10	12	NULL	Yes	No	Yes	DSL	Yes	Yes	Yes	Yes	Yes	Yes
5	11180-TAM	Male	75	Yes	Tamil Nadu	12	27	Deal 2	Yes	No	Yes	DSL	Yes	No	No	Yes	Yes	Yes

13	11277-UTT	Male	66	Yes	Uttar Pradesh	10	23	NULL	Yes	No	Yes	DSL	No	Yes	Yes	No	No	No
14	11288-MAD	Male	52	No	Madhya Pradesh	6	24	NULL	Yes	No	No	NULL	NULL	NULL	NULL	NULL	NULL	NULL
15	11290-JAM	Female	70	Yes	Jammu & Kashmir	0	36	Deal 5	Yes	Yes	Yes	Fiber Optic	No	No	No	Yes	Yes	Yes
16	11301-WES	Female	31	No	West Bengal	7	5	Deal 3	Yes	Yes	Yes	Cable	No	No	No	No	No	No
17	11310-RAJ	Female	78	Yes	Rajasthan	0	15	Deal 2	Yes	Yes	Yes	Fiber Optic	No	No	Yes	No	Yes	Yes
18	11340-JAM	Female	21	No	Jammu & Kashmir	8	7	NULL	Yes	No	No	NULL	NULL	NULL	NULL	NULL	NULL	NULL

Query executed successfully.

While looking at the gender column,

- I would like to know how many items are on the gender column
- What is the COUNT on each of these items.
- And I will need an additional column as an Alias which tells me the Percentage Distribution of this column.

The screenshot shows a SQL query in the 'Query Editor' window of SSMS. The code is as follows:

```
-- Use the churn database
USE churn_db;

-- Gender Distribution Analysis
SELECT
    Gender,
    COUNT(Gender) AS TotalCount, -- Count of each gender in the dataset
    COUNT(Gender) * 100.0 / (SELECT COUNT(*) FROM churn_main) AS Percentage -- Calculate percentage by dividing gender count by total rows and multiplying by 100

FROM
    churn_main
GROUP BY
    Gender; -- Grouping to get count and percentage for each gender
```

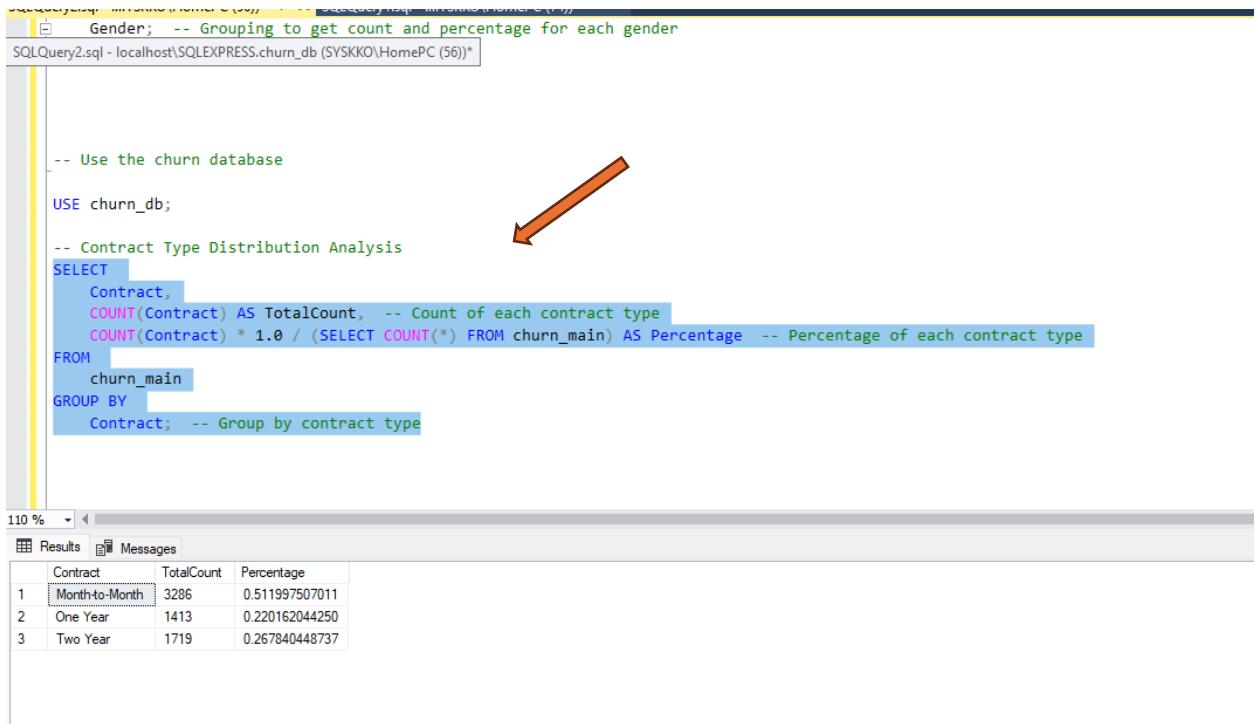

An orange arrow points from the text "Percentage Distribution" in the list above to the AS Percentage part of the query result set definition.

The results pane shows the following data:

Gender	TotalCount	Percentage
Male	2370	36.927391710813
Female	4048	63.072608289186

In this query, I explored the gender distribution within the `churn_main` table of the `churn_db` database. The goal is to understand the proportion of each gender represented in the dataset.

- `COUNT(Gender)` calculates the total number of records for each gender.
- The subquery `(SELECT COUNT(*) FROM churn_main)` returns the total number of rows in the table.
- Multiplying `COUNT(Gender) / total by 100.0` converts the proportion into a percentage representation of each gender in the dataset.

In this query, I analyzed how different **contract types** are distributed among customers.

- `COUNT(Contract)` gives the total number of **customers** for each **contract type**.
 - The subquery `(SELECT COUNT(*) FROM churn_main)` returns the total number of records in the dataset.
 - By Multiplying by `1.0` ensures **decimal division**, so I get the proportion as a **decimal percentage**.

Now I will be exploring the **Customer_Status** column

This column tells me if a customer has **stayed** or **churned(left)**

Now I will be checking for the **Customer_Status** for who stayed, churned, or joined.

	Customer_Status	Churn_Category	Churn_Reason
1	Stayed	NULL	NULL
4	Churned	Competitor	Competitor had better devices
	Stayed	NULL	NULL
5	Stayed	NULL	NULL
5	Stayed	NULL	NULL
3	Stayed	NULL	NULL
	Stayed	NULL	NULL
3	Stayed	NULL	NULL
5	Churned	Price	Price too high
1	Stayed	NULL	NULL
5	Churned	Dissatisfaction	Product dissatisfaction
8	Churned	Competitor	Competitor offered more data
1	Stayed	NULL	NULL
5	Stayed	NULL	NULL
4	Churned	Competitor	Competitor made better offer
6	Stayed	NULL	NULL
	Stayed	NULL	NULL
6	Stayed	NULL	NULL

SS (16.0 ... | SYSKKO\HomePC (54) | churn_db | 00:00:36 | 6,418 rows

```
-- Now i will be checking for the Customer_Status for who stayed, churned, or Joined.  
USE churn_db; -- Using the churn database  
-- Revenue breakdown by customer status  
SELECT  
    Customer_Status,  
    COUNT(Customer_Status) AS TotalCount, -- Number of customers per status  
    SUM(Total_Revenue) AS TotalRevenue, -- Total revenue generated by each status group  
    SUM(Total_Revenue) * 100.0 / (SELECT SUM(Total_Revenue) FROM churn_main) AS RevenuePercentage -- Percentage share of total revenue  
FROM  
    churn_main  
GROUP BY  
    Customer_Status; -- Grouping results by customer status
```

	Customer_Status	TotalCount	TotalRevenue	RevenuePercentage
1	Joined	411	49281.5598697662	0.253097281975677
2	Churned	1732	3411960.5796299	17.5229426827105
3	Stayed	4275	16010148.2622757	82.2239600353138

In this query, I analyzed how customer status (e.g., Churned, Joined, Stayed) affects revenue contribution:

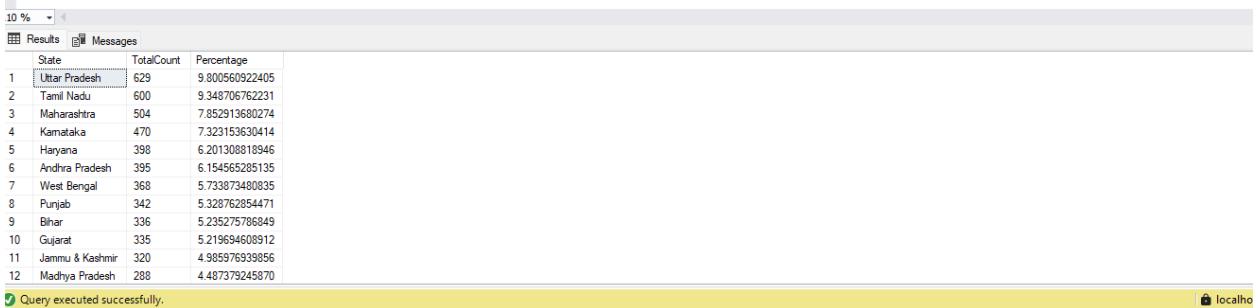

- `COUNT(Customer_Status)` shows how many customers belong to each group.
 - `SUM(Total_Revenue)` aggregates the revenue from each status group.
 - Dividing each group's revenue by the `total revenue` and multiplying by 100 gives the `percentage contribution` of each group.

And finally, I will start exploring the State column and see how many states represent what percentage of values

```
-- Finally i will start to explore the State column to see how many states
-- Represents what percentage the values shows.

USE churn_db; -- Using the churn database

SELECT State,
       COUNT(State) AS TotalCount,                                         -- Count the number of customers in each state
       COUNT(State) * 100.0 / (SELECT COUNT(*) FROM churn_main) AS Percentage -- Calculate the percentage of total customers for each state
FROM
    churn_main
GROUP BY
    State
ORDER BY
    Percentage DESC;                                                 -- Order the results by percentage in descending order (highest percentage first)
```

In this query, I analyzed how the **state** of customers (e.g., Churned, Joined, Stayed) affects their distribution:

- **COUNT(State)** shows how many **customers** belong to each **state** (such as 'Active', 'Churned', etc.).
 - The **COUNT(State) * 100.0 / (SELECT COUNT (*) FROM churn_main)** calculates the **percentage** of **total customers** that belong to each state. It compares the count of customers in each state to the total number of customers in the **churn_main** table.
 - The **ORDER BY Percentage DESC** sorts the results so that states with the highest percentage of customers appear at the top of the list.

2.4 Data Exploration – Data Cleaning - Null Value Checking

Now I will Find **Null** Values in Each column and Remove Null as Per Column Values.

N/B: NULL can create a lot of problems if I ignore it, so I will check the columns for **Missing NULL**

The screenshot shows a SQL query in the 'Query Editor' window of SSMS. The code is as follows:

```
-- Data Exploration - Check Nulls
-- Now I will Find Null Values in Each column and Remove Null As Per Column Values

USE churn_db; -- Select the churn database

SELECT
    -- Count of NULLs in Customer_ID column
    SUM(CASE WHEN Customer_ID IS NULL THEN 1 ELSE 0 END) AS Customer_ID_Null_Count,
    -- Count of NULLs in Gender column
    SUM(CASE WHEN Gender IS NULL THEN 1 ELSE 0 END) AS Gender_Null_Count,
    -- Count of NULLs in Age column
    SUM(CASE WHEN Age IS NULL THEN 1 ELSE 0 END) AS Age_Null_Count,
    -- Count of NULLs in Married column
    SUM(CASE WHEN Married IS NULL THEN 1 ELSE 0 END) AS Married_Null_Count,
    -- Count of NULLs in State column
    SUM(CASE WHEN State IS NULL THEN 1 ELSE 0 END) AS State_Null_Count,
```

An orange arrow points from the text "Count of NULLs in Customer_ID column" to the corresponding line in the code. The results pane shows a single row of data:

Customer_ID_Null_Count	Gender_Null_Count	Age_Null_Count	Married_Null_Count	State_Null_Count	Number_of_Referrals_Null_Count	Tenure_in_Months_Null_Count	Value_Deal_Null_Count	Phone_Service_Null_Count	Multiple_Lines_Null_Count	Internet_Service_Null_Count	Internet_Type_Null_Count	Online_Security_Null_Count
0	0	0	0	0	0	3548	0	622	0	1390	1390	1390

This query checks for **missing (NULL) values** in each column of the **churn_main** table.

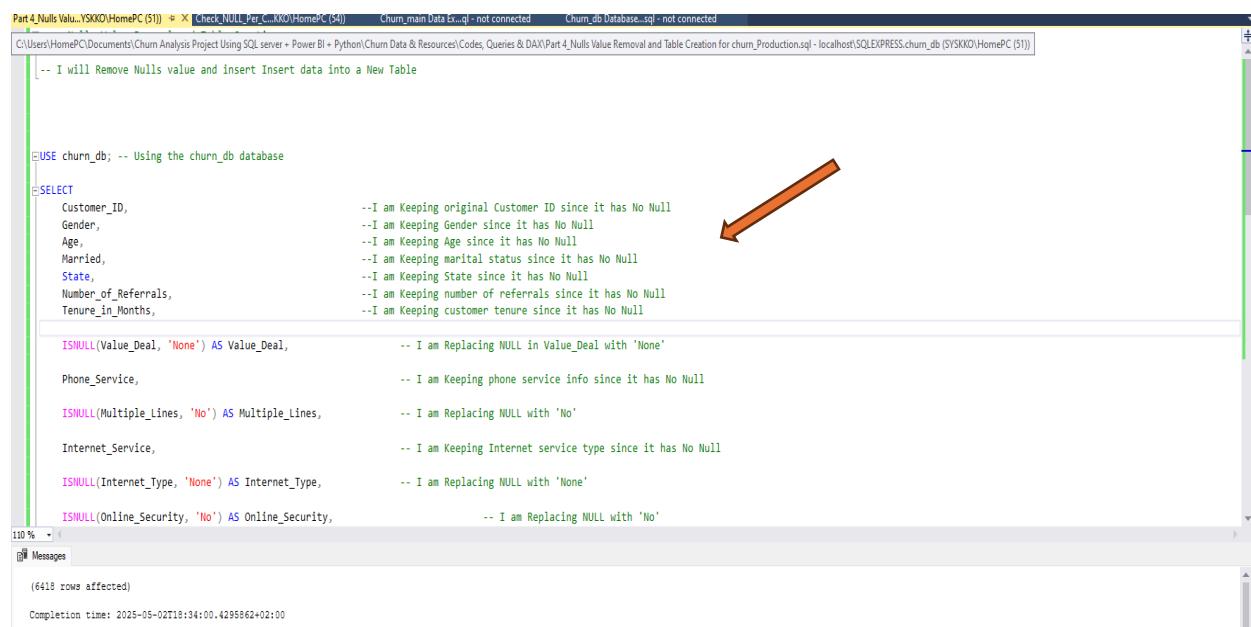

- It counts how many **NULLs** are in each column using **SUM(CASE WHEN column IS NULL THEN 1 ELSE 0 END)**.
- This result tells me which **columns** have missing data.
- Is First Assigning **NULL Values As 1** and else 0 and saves it As an **Alias**

2.5 Data Exploration – Data Cleaning - Null Value Removal

Now the next Step, is to Remove this **NULLs Values**

I will be replacing these **Nulls values** and inserting the data into a new table which will be a **Production Table**.

This table will be used as the source of all upcoming steps

```
-- I will Remove Nulls value and insert Insert data into a New Table

USE churn_db; -- Using the churn_db database

SELECT
    Customer_ID, --I am Keeping original Customer ID since it has No Null
    Gender, --I am Keeping Gender since it has No Null
    Age, --I am Keeping Age since it has No Null
    Married, --I am Keeping marital status since it has No Null
    State, --I am Keeping State since it has No Null
    Number_of_Referrals, --I am keeping number of referrals since it has No Null
    Tenure_in_Months, --I am Keeping customer tenure since it has No Null

    ISNULL(Value_Deal, 'None') AS Value_Deal, -- I am Replacing NULL in Value_Deal with 'None'
    Phone_Service, -- I am Keeping phone service info since it has No Null
    ISNULL(Multiple_Lines, 'No') AS Multiple_Lines, -- I am Replacing NULL with 'No'
    Internet_Service, -- I am Keeping Internet service type since it has No Null
    ISNULL(Internet_Type, 'None') AS Internet_Type, -- I am Replacing NULL with 'None'
    ISNULL(Online_Security, 'No') AS Online_Security, -- I am Replacing NULL with 'No'

    (6418 rows affected)
Completion time: 2025-05-02T18:34:00.4295862+02:00
```

In this **step**, I performed data cleaning by **removing or handling NULL values** and saved the cleaned results into a new table called **churn_Production**:

- I used the **ISNULL()** function to **replace NULLs** with default values for specific columns:
 - For service-related columns like **Multiple_Lines**, **Online_Security**, etc., I replaced **NULL** with '**No!**'

- For `Value_Deal` and `Internet_Type`, I replaced `NULL` with 'None'.
 - For churn-related fields like `Churn_Category` and `Churn_Reason`, I replaced `NULL` with 'Others'.
 - I kept columns like `Customer_ID`, `Gender`, `Age`, `Contract`, and others **unchanged** because they **didn't contain any NULLs**.
 - Finally, I saved the cleaned data onto a **new table** called `churn_Production` to keep the original data intact and work with a clean version going forward.

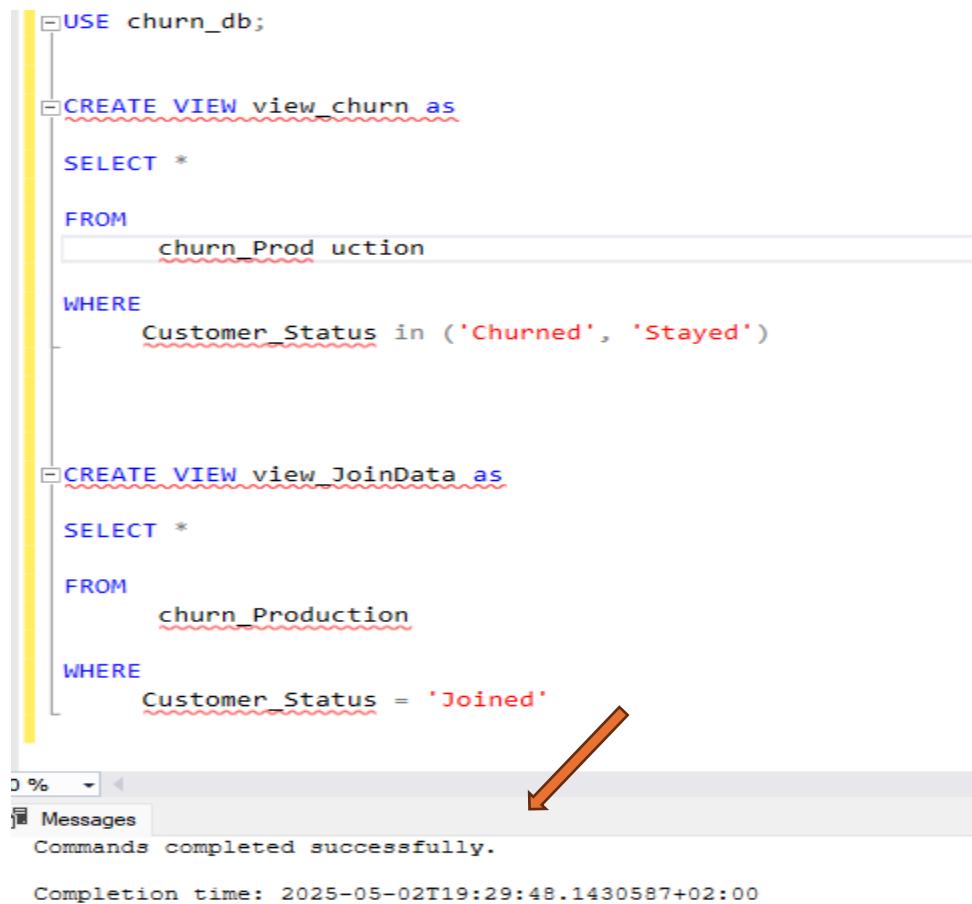

Churn_Production has now appeared on the explorer panel.

|||||

2.6 Data Exploration – View for Visual Table

In a Database, the main purpose of VIEW is to create a Virtual Table, so as this view will not have any physical Presence on the Database itself, which I am being careful of, and it will provide me with the Output when a Query calls for it

```
USE churn_db;

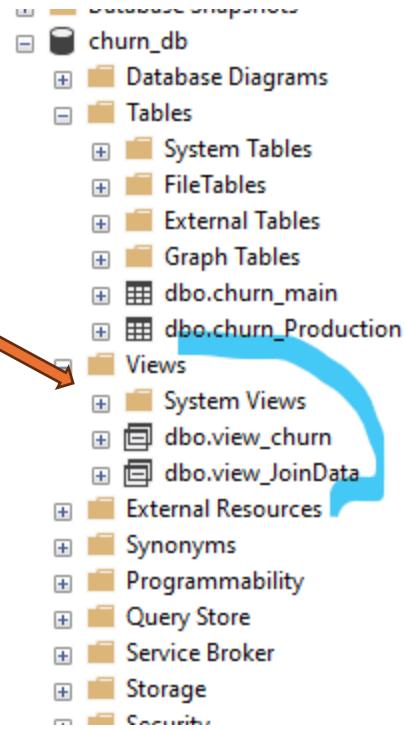

CREATE VIEW view_churn AS
SELECT *
FROM
    churn_Production
WHERE
    Customer_Status in ('Churned', 'Stayed')

CREATE VIEW view_JoinData AS
SELECT *
FROM
    churn_Production
WHERE
    Customer_Status = 'Joined'

0 % < 
Messages
Commands completed successfully.

Completion time: 2025-05-02T19:29:48.1430587+02:00
```

The Dropdown message shows success and if you look at the left-hand corner of the explorer panel, you will see the view option

Now that's my **virtual table**

Now all data from the **churn_Production** table will be on the view

Now I will move into the **Power BI Visualization Tool**, which is a powerful business intelligence platform used to create interactive dashboards and visual reports from the cleaned and processed data.

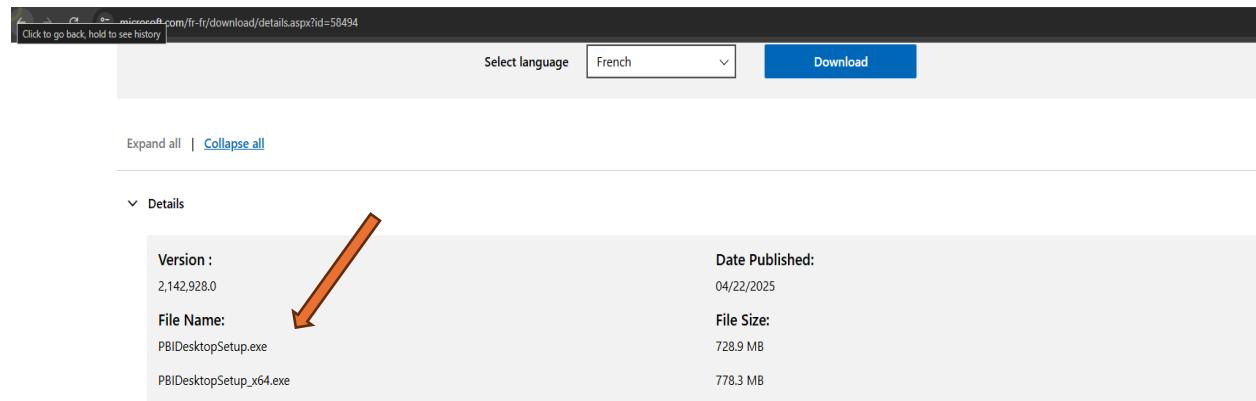

I'm done with the **SQL aspect** of this Project.

//////////
//////////

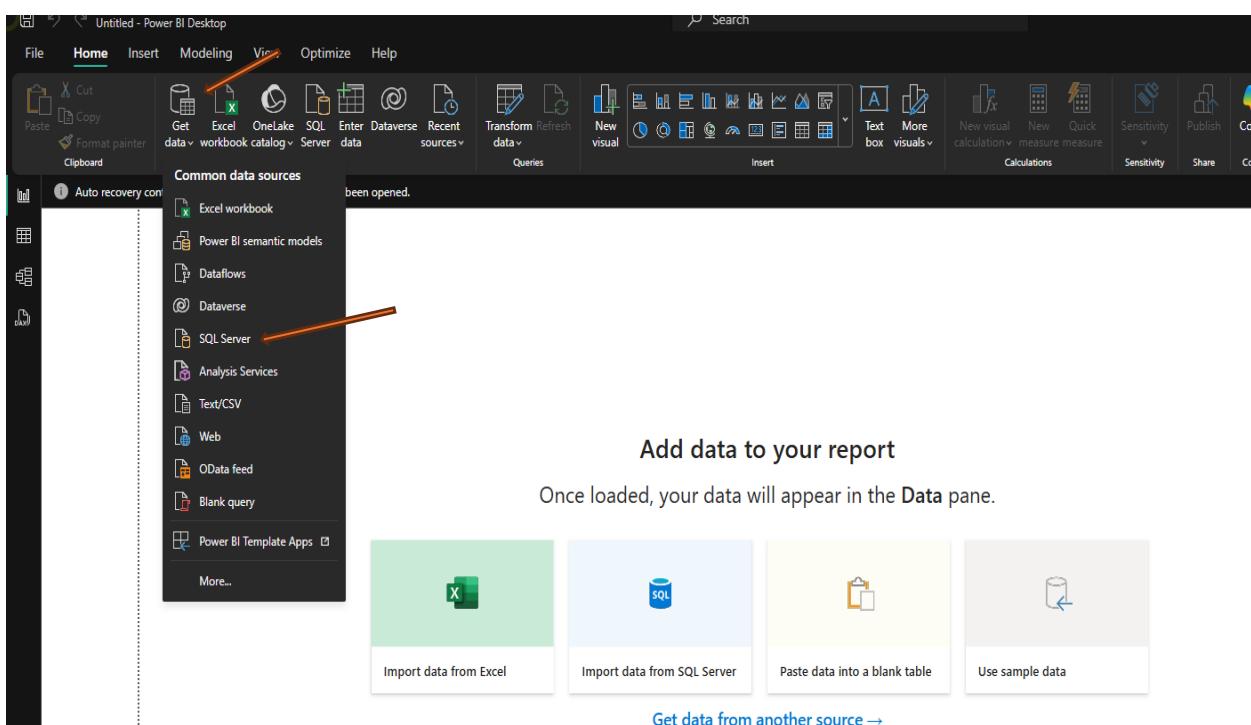

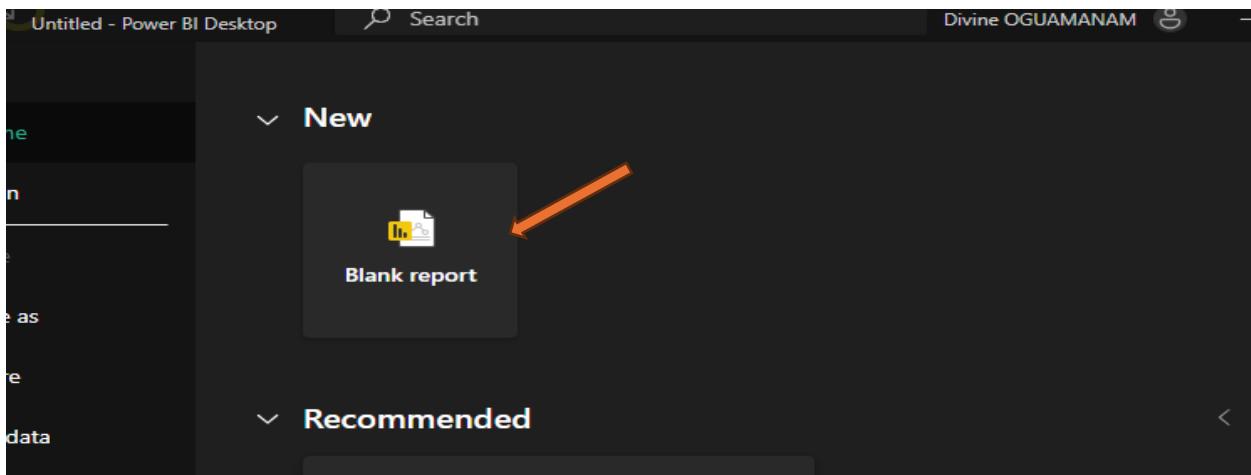

3 Power BI Transform

I will be using the Microsoft Power BI Desktop Application for my visualization.

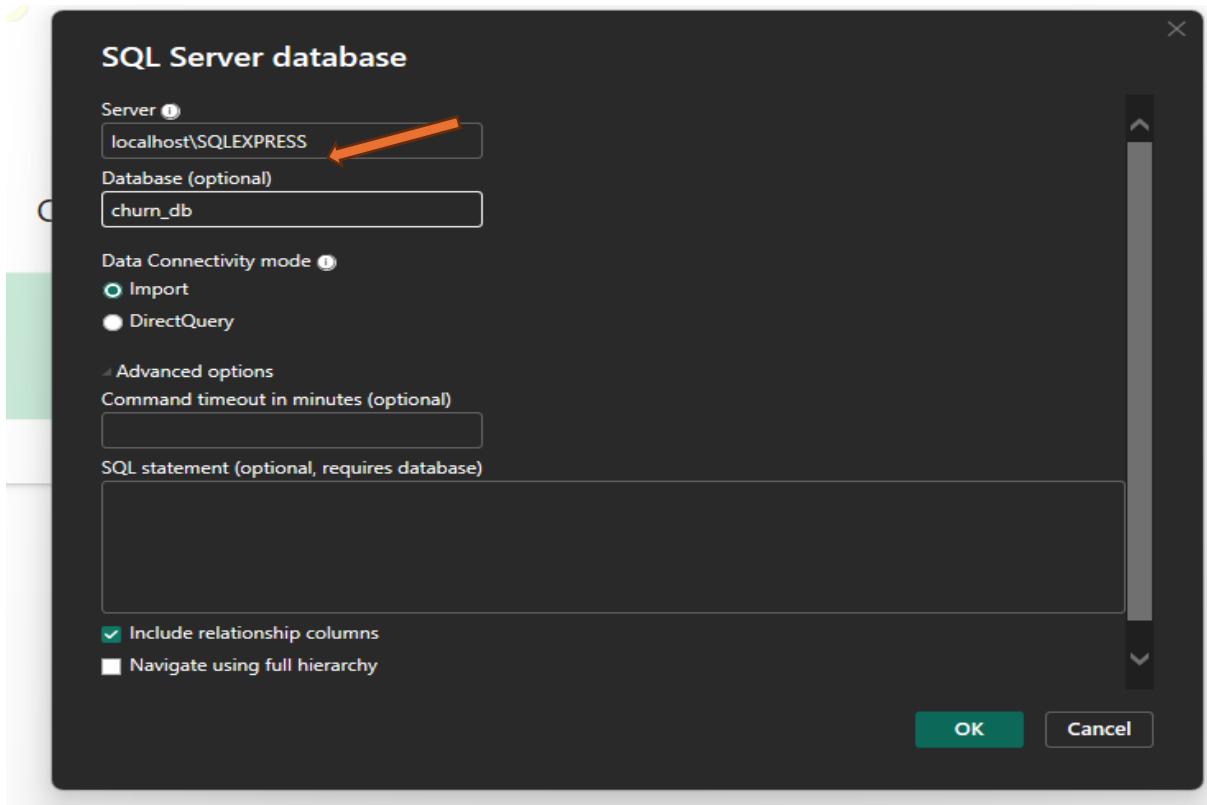

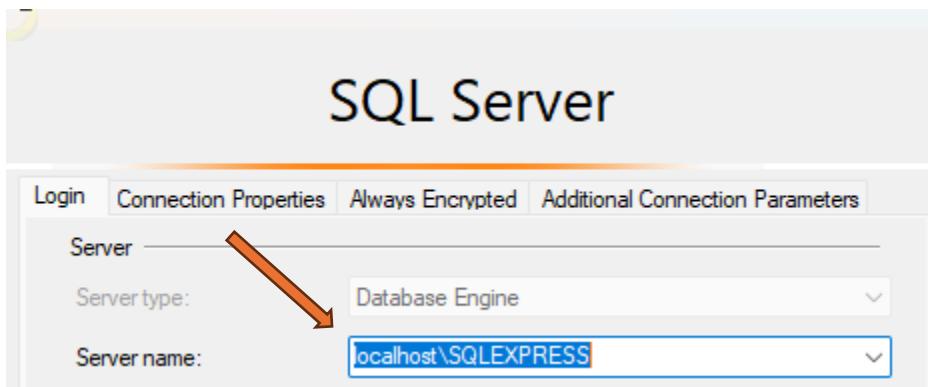

<https://www.microsoft.com/fr-fr/download/details.aspx?id=58494>

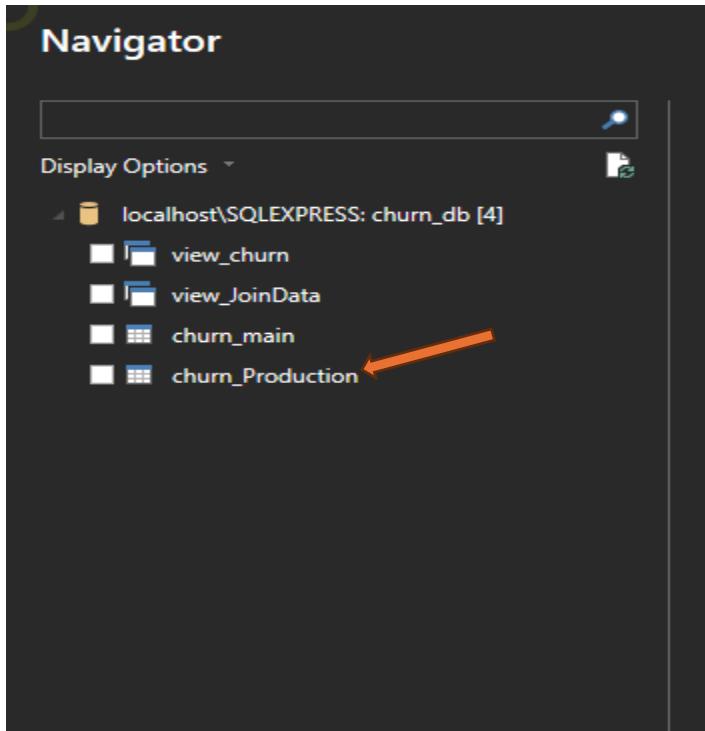

After completing the download and installation, I will open a **blank report**. Since I want to import my **SQL queries**, I will click the **Get Data** button in the top left corner and select the **SQL Server** option.

Now I will copy my server's name and import on the server and click on import, which is on my connection page of my SQL server Application.

Then I will click on OK, which will prompt me to the **Navigator panel**

Now I will select the **churn_production** and click on **transform Data** which will prompt me to the **power query editor** where I will **transform** and edit this data.

The screenshot shows the Power Query Editor window titled 'Untitled - Power Query Editor'. The ribbon menu includes Home, Transform, Add Column, View, Tools, and Help. The 'Queries [1]' tab shows a single query named 'churn_Production'. The data preview shows a table with the following columns and data:

	Customer_ID	Gender	Age	Married	State	Number_of_Referrals	Tenure_in_Months	Value_Deal	Phone_Service
1	11098-MAD	Female	39	Yes	Madhya Pradesh	0	27	Deal 1	Yes
2	11114-PUN	Male	51	No	Punjab	5	9	Deal 5	Yes
3	11167-WES	Female	47	Yes	West Bengal	3	28	Deal 1	Yes
4	11179-MAH	Male	35	No	Maharashtra	10	17	None	Yes
5	11180-TAM	Male	75	Yes	Tamil Nadu	12	27	Deal 2	Yes

34	11596-KAR	Female	48	No	Karnataka	15	11	Deal 4	Yes

The 'APPLIED STEPS' pane on the right shows a single step named 'Navigation'.

Now I will need to create a couple of columns based on certain conditions.

Customer_Status	Total_Revenue	Customer_Status
631.7199	1.2	A
122.3700	Z	B
1872.97	A	C
219.3899	Customer_Status	
332.0799		
95.87999		
305.7999		
20.56999		
4.889999		
90.08999		
133.0200		
136.6300		
2112.320		
126.4400		
641.4199		
1535.400		
78.5999847	298.1000061	Stayed

Looking at the **Customer_Status** column which has three values which are stayed, churned, and joined. I would like to create another column which will be a number column which defines whether a certain row is for **churned or not**

- I will click on add column then custom column and call it **churn status**
- And add this DAX formulae to it **If [Customer_Status] = “Churned” then 1 else 0**

110 | 1872.97998 | 10237.91016 Stayed | Others

Custom Column

Add a column that is computed from the other columns.

New column name: **churn status**

Custom column formula:

```
= if [Customer_Status] = "Churned" then 1 else 0
```

Available columns:

- Customer_ID
- Gender
- Age
- Married
- State
- Number_of_Referrals
- Tenure_in_Months

<< Insert

Learn about Power Query formulas

✓ No syntax errors have been detected.

OK Cancel

110 | 1872.97998 | 10237.91016 Stayed | Others

Custom Column

Add a column that is computed from the other columns.

New column name: **churn status**

Custom column formula:

```
= if [Customer_Status] = "Churned" then 1 else 0
```

Available columns:

- Customer_ID
- Gender
- Age
- Married
- State
- Number_of_Referrals
- Tenure_in_Months

<< Insert

Learn about Power Query formulas

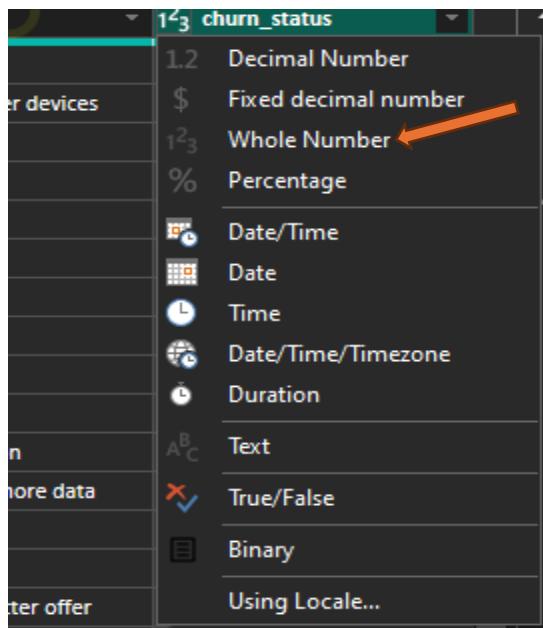

✓ No syntax errors have been detected.

OK Cancel

123	churn status

	1
	0
	0

Having been added, I renamed the column to **churn_status**

Now I have the column I will have to change it from **string text** to **whole number**

I will be using this column to do some **calculations**

Now I will be creating another column called **Monthly_ChargeStatus**

Using this formula **if [Monthly_charge] < 20 then “<20” else if [Monthly_Charge] < 50 then “20-50” else if [Monthly_Charge] < 100 then “50-100” else “>100”**

The screenshot shows the 'Custom Column' dialog box. The 'New column name' field contains 'Monthly_Charge'. The 'Custom column formula' field contains the following Power Query formula:

```
= if [Monthly_Charge] < 20 then "<20"
else if [Monthly_Charge] < 50 then "20-50" else if
[Monthly_Charge] < 100 then "50-100" else ">100"
```

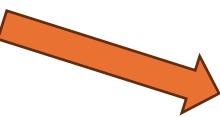

The 'Available columns' list includes: Customer_ID, Gender, Age, Married, State, Number_of_Referrals, Tenure_in_Months, and V1. Below the formula field, there is a link to 'Learn about Power Query formulas'. At the bottom, a green checkmark indicates 'No syntax errors have been detected.' and there are 'OK' and 'Cancel' buttons.

The reason for this is that the **Monthly_Charge** column contains a wide range of values, which can make it difficult to process effectively during the visualization stage. To address this, I created a new column called **Monthly_ChargeStatus** that categorizes the values into defined ranges, making the data easier to analyze and visualize.

1.2 Monthly_Charge
95.09999847
49.15000153
116.0500031
84.40000153
72.59999847
105.0999985
76
25.20000076
95.09999847
99.6500015
-4
75.84999847
54.79999924
20.20000076
95.44999695
51.54999924
102.1500015
19.95000076
56.04999924
20.5
59.09999847
84.40000153
112.5500031
101.5500031
75.55000305
99.8499985
55.40000153
75.59999847
95.90000153
58.75
104.0999985
46.20000076
49.40000153
49.20000076
104.4000015
68.69999695

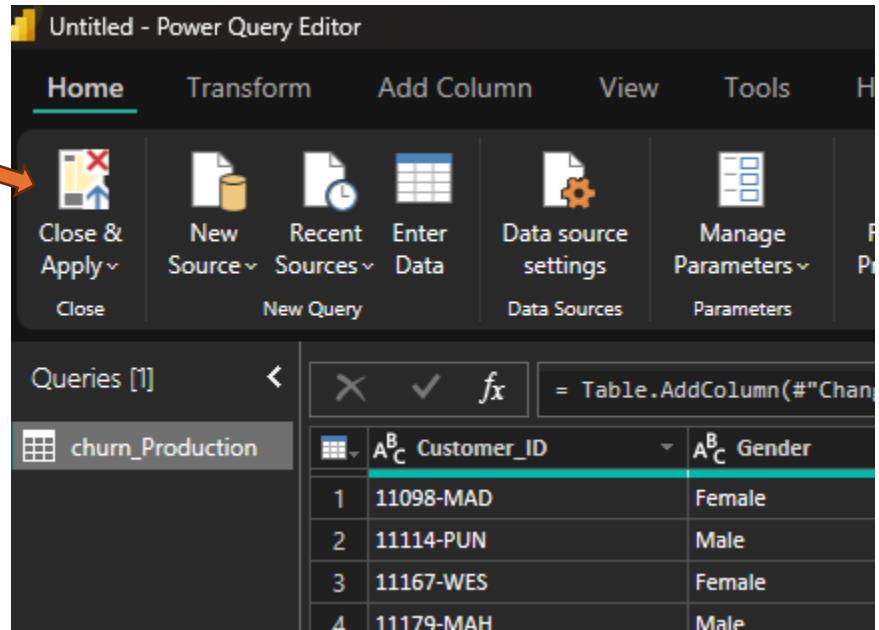

This is the numerous values on it

Now down below is the new **range column**

ABC	Monthly_ChargeStatus
123	50-100
	20-50
	>100
	50-100
	50-100
	>100
	50-100
	20-50
	50-100
	50-100
	<20
	50-100
	50-100
	20-50
	50-100
	50-100
	>100
	<20
	50-100
	20-50
	50-100
	50-100
	>100
	>100
	50-100
	50-100
	50-100
	50-100
	>100
	20-50
	20-50
	>100
	50-100

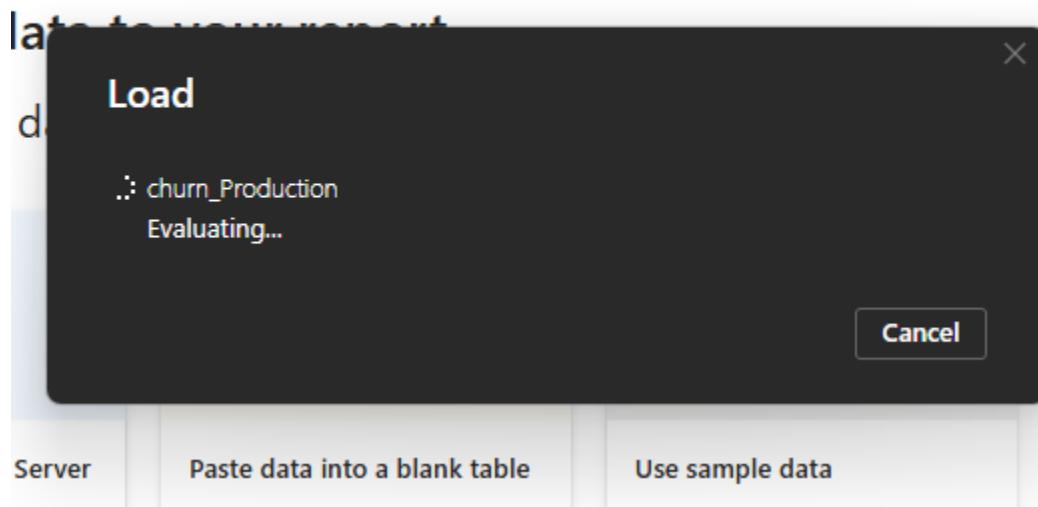

Now I will close and **apply changes** to the Data

The screenshot shows the Power Query Editor interface. The title bar says "Untitled - Power Query Editor". The ribbon has tabs: Home, Transform, Add Column, View, Tools, Help. The Home tab is selected. Below the ribbon is a toolbar with icons: Close & Apply (highlighted with an orange arrow), New Source, Recent Sources, Enter Data, Data source settings, Manage Parameters, and Refresh. The main area shows a query named "churn_Production" with a table containing four rows of data:

	Customer_ID	Gender
1	11098-MAD	Female
2	11114-PUN	Male
3	11167-WES	Female
4	11179-MAH	Male

A formula bar at the top shows the formula: = Table.AddColumn(#"Chang...".

The screenshot shows a "Load" dialog box. The title bar says "Load" and there is a close button "X". The main area displays the message: "churn_Production" and "Evaluating...". At the bottom right is a "Cancel" button. Below the dialog are three buttons: "Server", "Paste data into a blank table", and "Use sample data".

Is loading into the **worksheet**

Now the **Data pane** by the right corner is showing the **churn_Production**

The screenshot shows the Power BI interface with the 'Data' pane open on the right. The 'Suggestions' pane on the left contains various icons for data sources like Excel, CSV, and databases. The 'Data' pane lists the columns of the 'churn_Production' dataset. A red arrow points to the dataset name 'churn_Production' in the list.

Total_Long_Distance_Rate

At this point I had to save my file by pressing **CTRL S** and inputting the name as
Chun Analysis

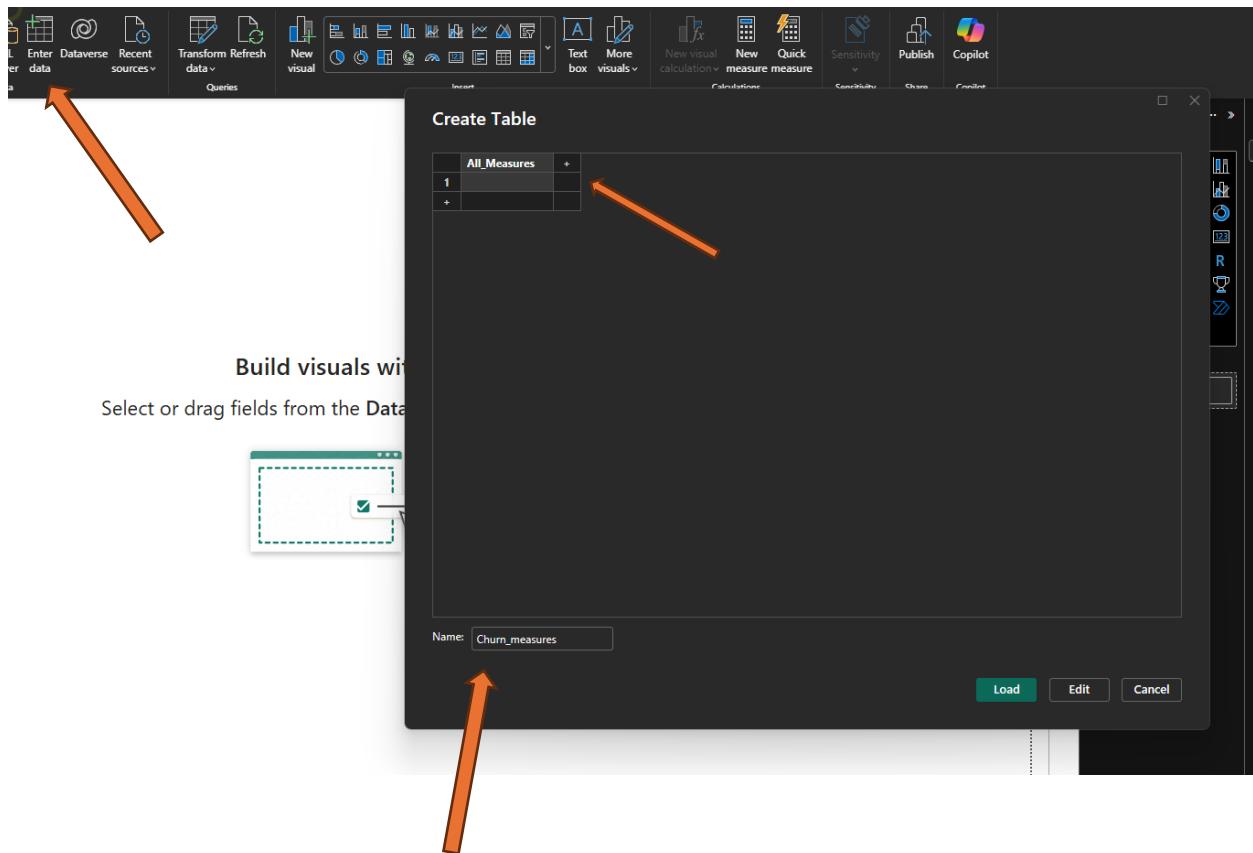

3.1 My Summary Page Blueprint

This is a list of visuals that will be on my **summary page** dashboard

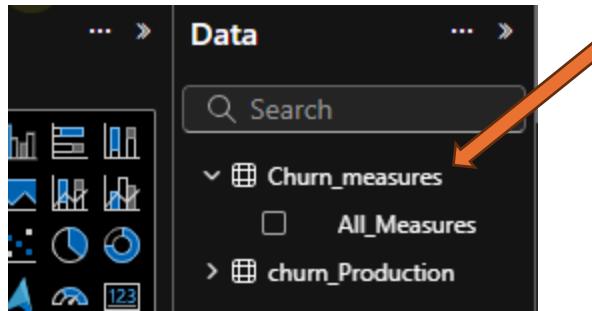

- Total Customers
- New joiners
- Total churn
- Churn Rate
- Gender
- Age
- Geographic
- Services
- Payment Method & Contract
- Tenure
- Churn Distribution
- Services

Before I start to create charts, I would like to create **a few measures** and keep them separate from the **main tables**, that way is easy for me to edit the measure in case is required in the future.

- I am going to create a **dummy table** where I will insert my measures manually to keep all my **measures** inside of it

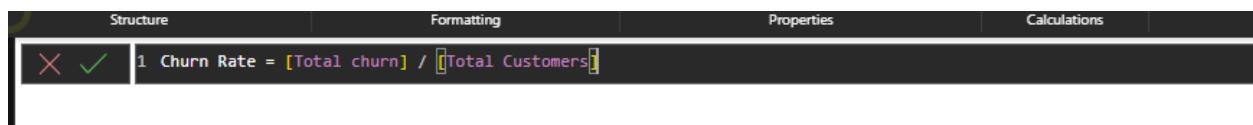

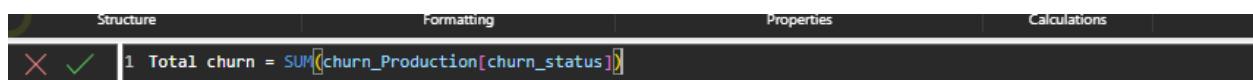

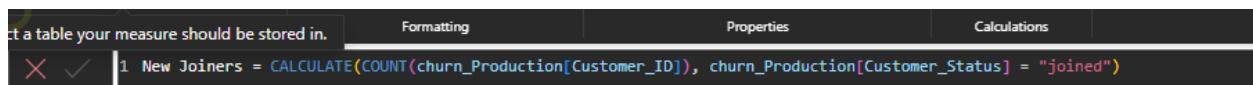

- Now I will click on Enter Data and this page will pop up, this is where I will input my table name as **Churn_Measures** and column as **All_Measures**

Now it has appeared on the **Data pane**.

I will create new different measures by clicking right beside the **churn_measure** and clicking on **new measure** and write several Dax formulae's

Now I am done with the measures I will be visualizing with; it is time for me to save my files so I wouldn't lose my project **CTRL S**

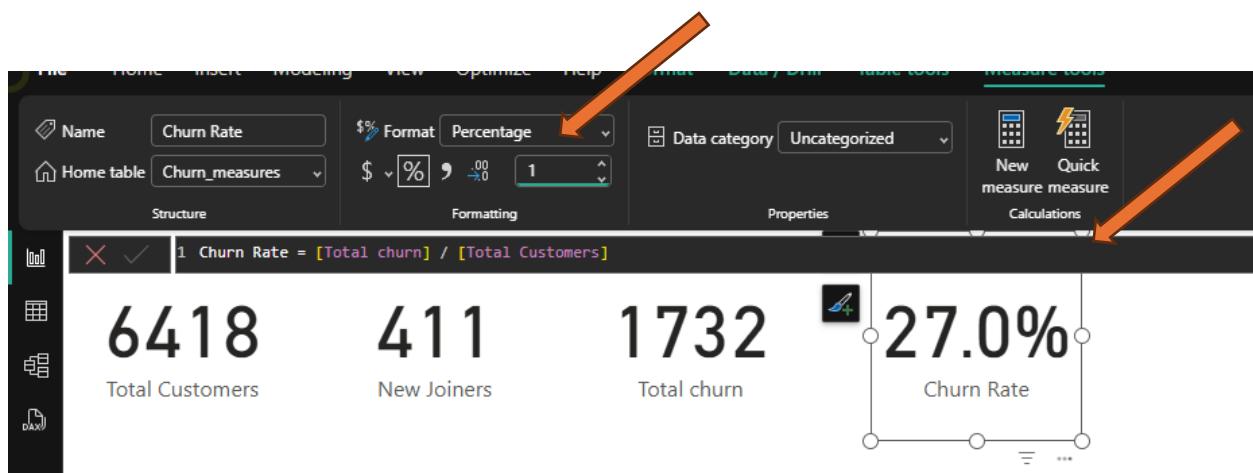

//////////
//////////

3.2 VISUALIZATION

First visuals I must create are

- Total Customers
- New joiners
- Total Churn
- Churn Rate

I will drop in few Cards from the **visualization pane** with its measures

I changed the churn rate to **percentage** 1 decimal value, and I did same with the comma as well for both **6418** and **1732**.

Now I am done with the Metrics, I will be diving into the individual categories available which are

- Gender
- Age
- Geographic

- Payment Method & Contract
- Tenure
- Churn Distribution
- Services

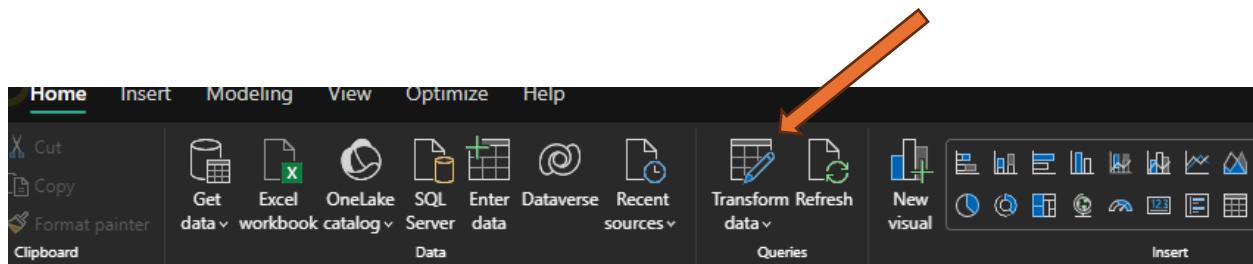

I am going to use the **donut chart** for gender by going to the **churn_production** table and click on **gender** and then the **donut chart**.

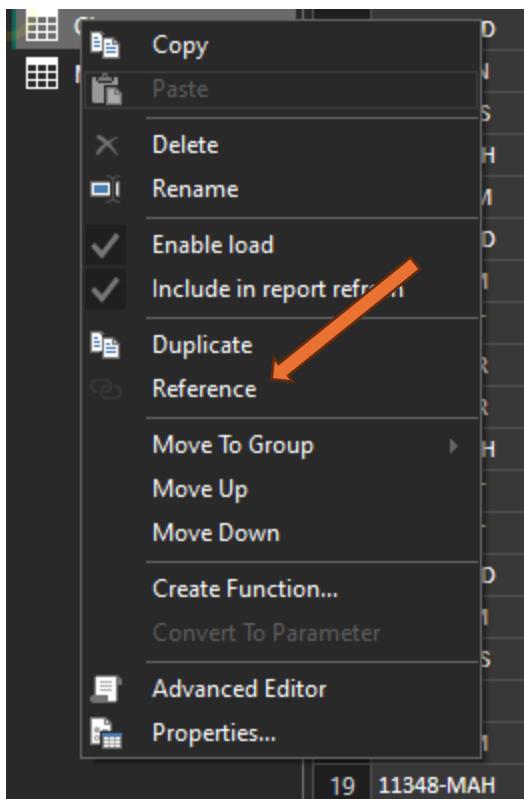

I will drag **total churn** from the **All_Measure table** into the donut chart

Now I will do some formatting

As for the **Age column**, since there are a lot of age digits clustered all around, it wouldn't be easy to understand it when it gets **visualized**.

So, I will head to **transform Data** which will take me to **power query** whereby I will reference the **churn_production** table.

Changed it to **Mapping_AgeGroup**

Queries [3] <

	1.2 Age	ABC 123 Age_Group
1		23 20-35
2		46 35-50
3		69 >50
4		29 20-35
5		75 >50
6		52 >50
7		72 >50
8		66 >50
9		78 >50
10		32 20-35
11		26 20-35
12		35 35-50
13		63 >50
14		43 35-50
15		55 >50
16		49 35-50
17		67 >50
18		27 20-35
19		21 20-35
20		58 >50
21		81 >50
22		64 >50
23		38 35-50
24		44 35-50
25		50 >50
26		24 20-35
27		47 35-50
28		70 >50
29		30 20-35
30		18 <20
31		84 >50
32		61 >50
33		41 35-50
34		65 >50
35		79 >50
36		19 <20

I created a new column as well with the formulae and I removed every other column beside Age

Age Group = if [Age] < 20 then “< 20” else if [Age] < 36 then “20 – 35” else if [Age] < 51 then “36 – 50” else “> 50”

AgeGrpSorting = if [Age Group] = “< 20” then 1 else if [Age Group] = “20 – 35” then 2 else if [Age Group] = “36 – 50” then 3 else 4

Then I changed Change data type of AgeGrpSorting to Numbers

Now when I checked the model view section, I saw that my Mapping_AgeGroup is already linked to the churn_Production table.

This shows that I can easily use this Age inside of it to filter all columns on the churn_Production table

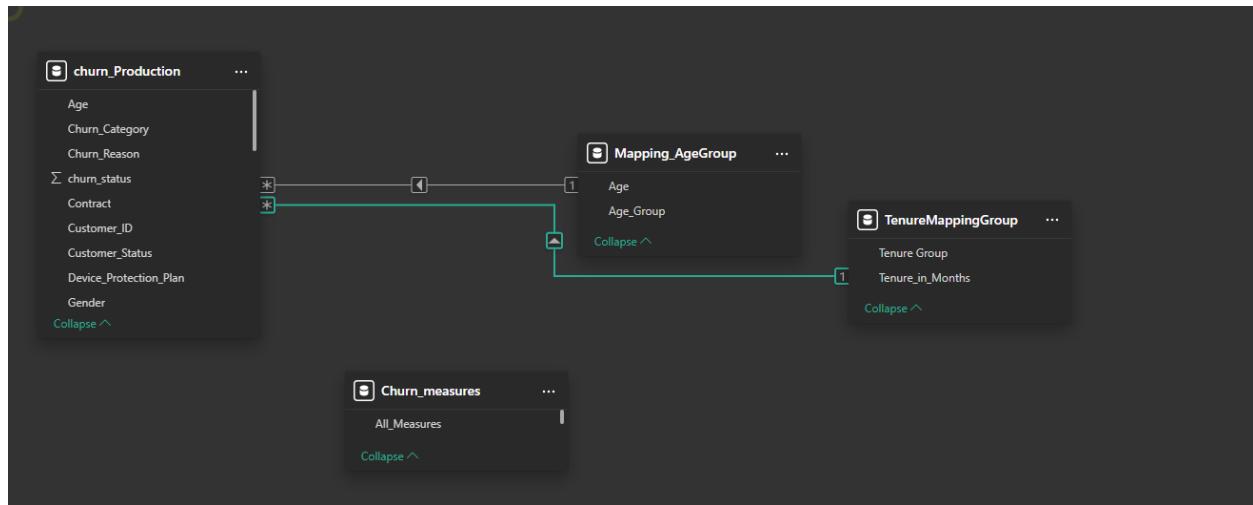

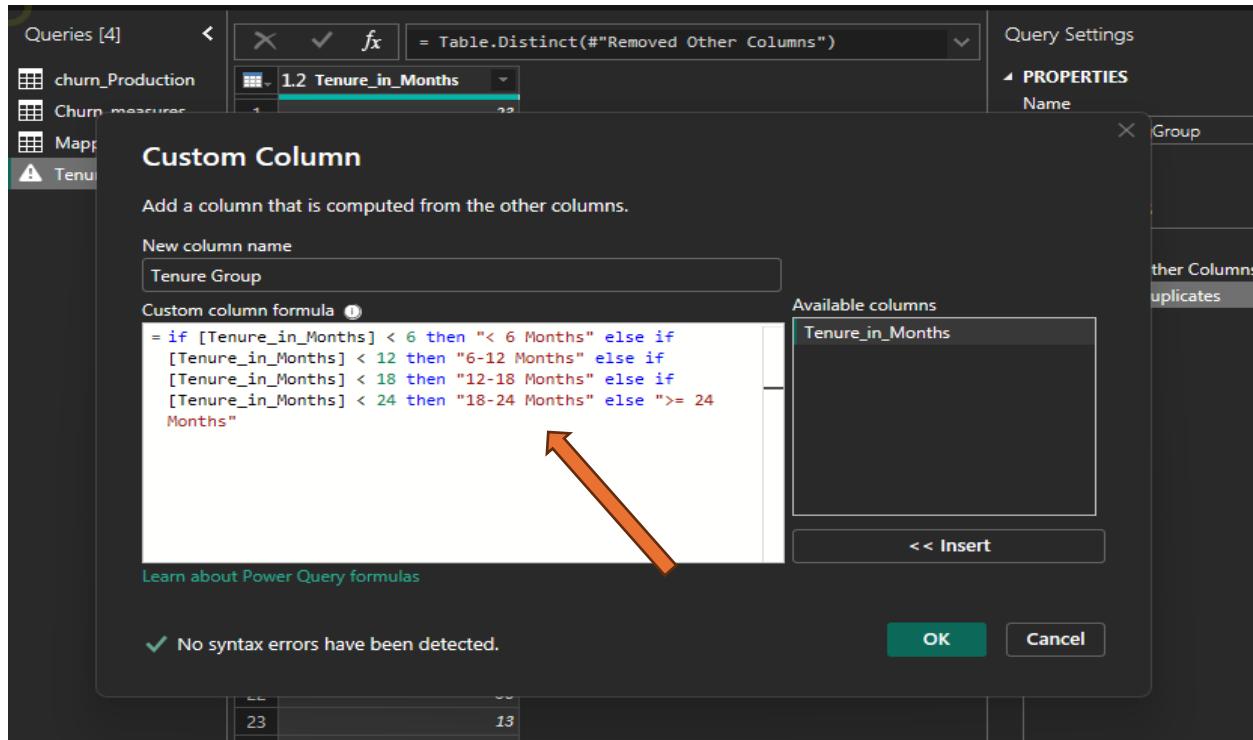

This is a **line and stacked chart** and my reason for using **total customers** and churn rate is because I would love to compare my churn rate with the number of customers that are available.

Now I am done with **Demographics** I will start with the **Account information**

I will be using the Clustered Bar chart for the **Payment method By Total churn**

I will be using the Clustered Bar chart for the **Contract by Churn Rate**

For **Tenure** I will have to Transform **tenure** since it has so many values which might affect my **visualization**, I will do the same as I did for **Age**.

Power BI has already done the connection on the model view

I will be using the Line & stacked Bar Chart for the **Total Customers** and **Churn Rate** by **Tenure Group**

Total Customers and Churn Rate by Tenure Group

Total Customers

Churn Rate

I dragged the churn rate from the **x axis** to the **y axis** to create that line

Looking at the x axis, it is not sorted in order so I will have to go back to transform and sort both the **Mapping_AgeGroup** and **TenureMappingGroup**

Custom Column

Add a column that is computed from the other columns.

New column name: AgeGroupSorting

Custom column formula:

```
= if [Age_Group] = "20" then 1 else if [Age_Group] = "20-35" then 2 else if [Age_Group] = "35-50" then 3 else 4
```

Available columns:

- Age
- Age_Group

Mapping_AgeGroup ...

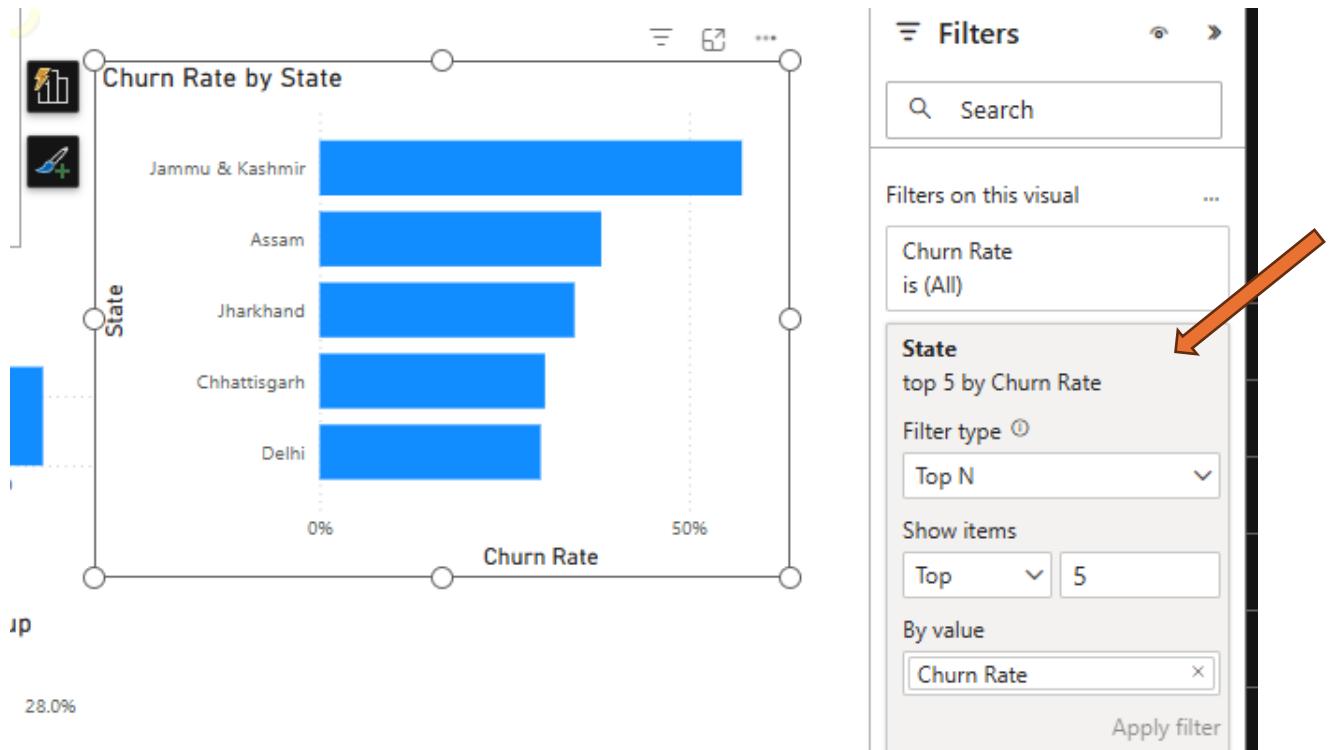

- Age
- Age_Group
- AgeGroupSorting

TenureMappingGroup

- Tenure Group
- Tenure_in_Months
- TenureGroupSo...

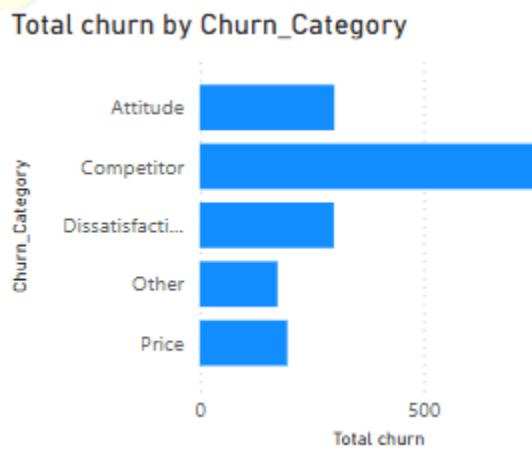

Is now showing on the **Data pane**

I will do the **churn rate** by state using the **clustered bar chart**, since there are a lot of states, I need the top **5 states** with the highest **churn rate**.

I filtered it with the churn rate, which I dragged **churn rate** to the value box and from **Basic filtering** to **Top N**

- Now, the next step is to visualize **Churn Distribution** using the **churn_category** column with a **Clustered Bar Chart**.
- The reason I'm focusing on **Total Churn** instead of **Churn Rate** is because I'm analyzing the **churn_category**, and it's essential to include all categories in the analysis to get a complete picture.

Now, I will perform the analysis for the **Internet_Type** column and visualize it using a **Clustered Bar Chart**. This time, I will include the **Churn Rate** to better understand how **churn varies** across different types of **internet services**.

Lastly, I want to **create a visual** that consolidates all the **telecom services** into a single view. This will provide a comprehensive **overview of service usage** or **churn patterns** across multiple services, making it easier to identify trends and insights immediately.

Before I start, I need to rearrange all the **telecom service** columns into a **grid format** so that I can easily **visualize** and compare the services in one chart.

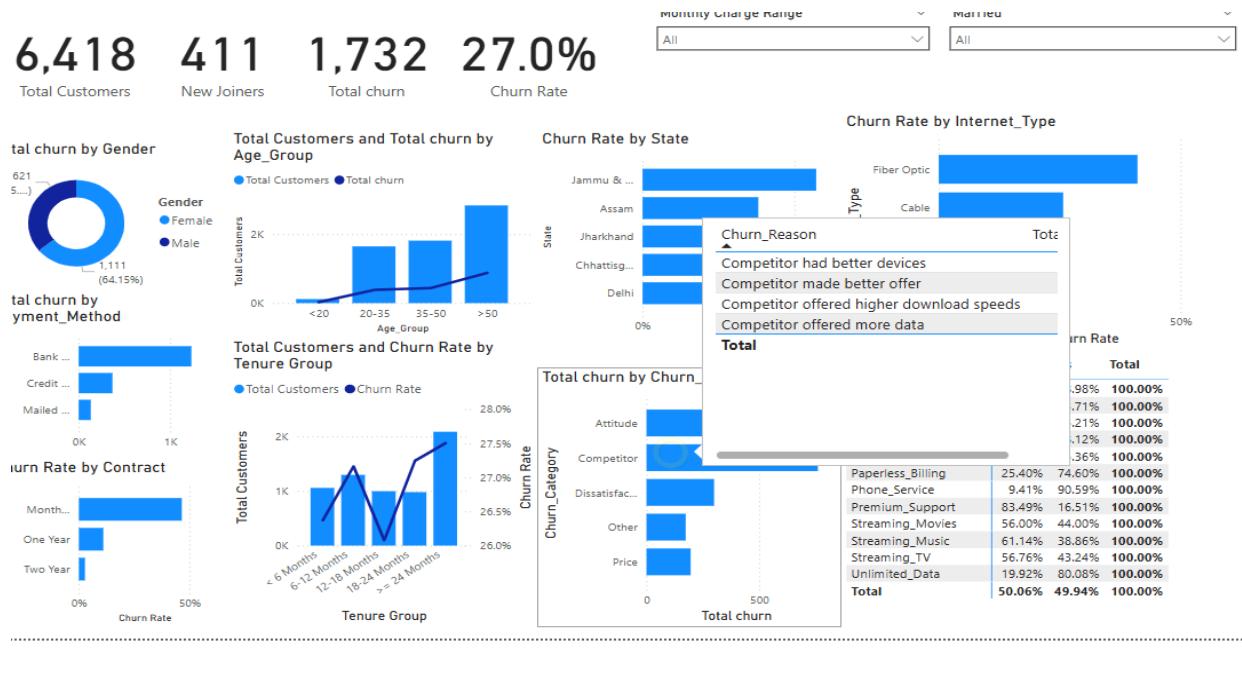

I clicked on **Transform Data**, which took me to the **churn_production** table. I created a **reference** for it and renamed it to **services_production**. Then, I used **Ctrl** to select all the columns related to services, went to the **Transform** tab above, and clicked on **Unpivot Columns** to rearrange the data for easier visualization.

A ^B _C Attribute	A ^B _C Value
Customer_ID	11098-MAD
Phone_Service	Yes
Multiple_Lines	No
Internet_Service	Yes
Online_Security	Yes
Online_Backup	Yes
Device_Protection_Plan	No
Premium_Support	Yes
Streaming_TV	No
Streaming_Movies	Yes
Streaming_Music	Yes
Unlimited_Data	Yes
Paperless_Billing	No
Customer_ID	11114-PUN
Phone_Service	Yes
Multiple_Lines	No
Internet_Service	Yes
Online_Security	No
Online_Backup	No
Device_Protection_Plan	Yes
Premium_Support	No
Streaming_TV	No
Streaming_Movies	No
Streaming_Music	No
Unlimited_Data	No
Paperless_Billing	Yes
Customer_ID	11167-WES
Phone_Service	Yes
Multiple_Lines	Yes
Internet_Service	Yes
Online_Security	Yes
Online_Backup	Yes
Device_Protection_Plan	Yes
Premium_Support	Yes
Streaming_TV	Yes
Streaming_Movies	Yes

Now it added everything into 2 columns with the **Attributes** and **Values** which I changed the name to **services** and **status**

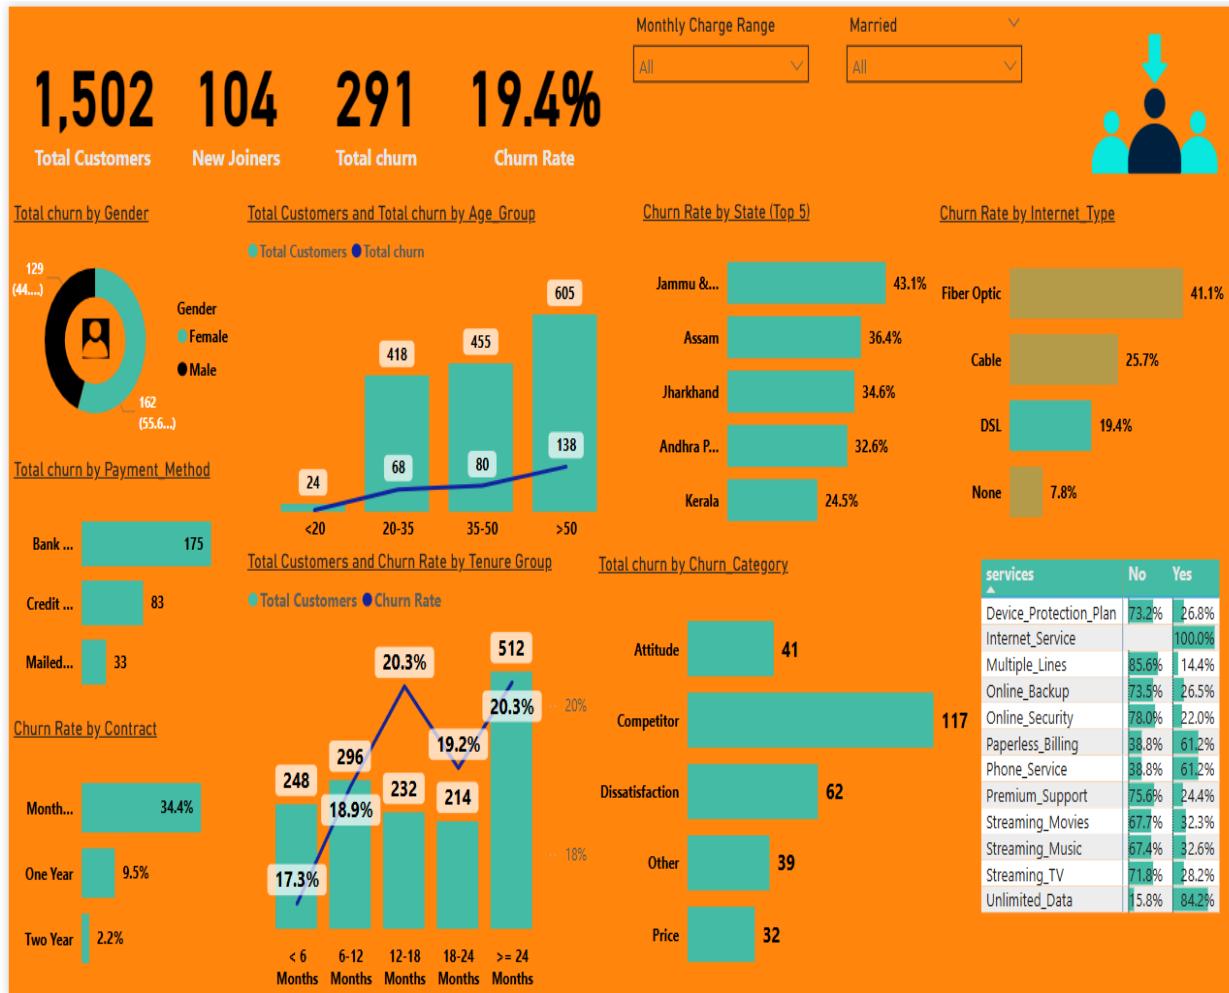

Now, I will click on **Service**, which will appear in the **Fields pane**. Then, I'll select the **Matrix** visual from the **Visualizations pane**. In the **Build pane**, I will drag **Status** to the **Columns** section and **Services** to the **Rows** section to display the data in a clear and organized grid format.

I will drag **Churn Status** to the **Values** section in the **Build pane**. By default, it shows the **sum of Churn Status**, but that's not what I want. I need to see the **percentage of each service** in terms of **Churn Status (Yes/No)**. So, I will click the dropdown on the field in the **Values** section, go to **Show Values As**, and select **Percent of Row Total** to display the data as percentages.

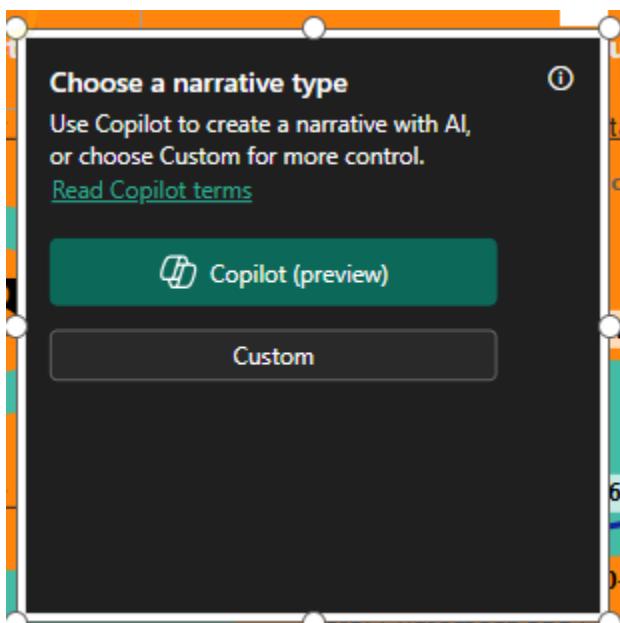

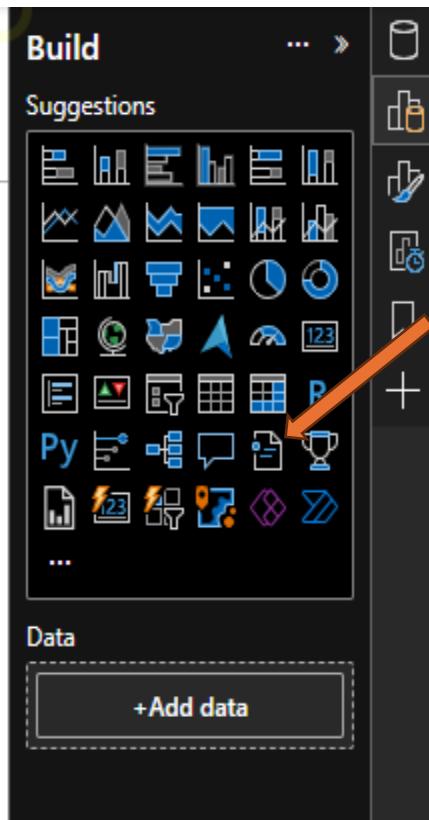

I analyzed churn by incorporating **Monthly Charge Range**, **Marital Status**, and **Service Usage** to understand **churn patterns**. I calculated churn rates for each service and visualized the **distribution of churn** reasons as a percentage of total churn. This helps identify which customer groups and services are most associated with churn and why customers are leaving.

3.3 Enhance Visualization

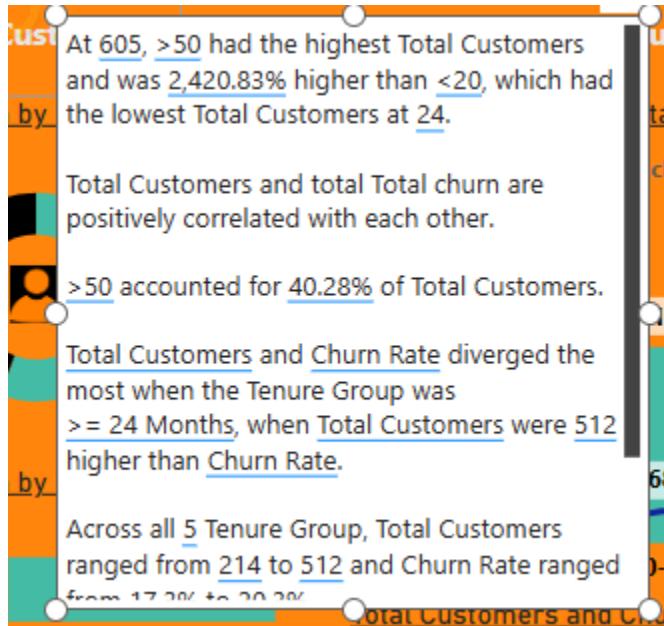

This interactive **Power BI dashboard** provides a comprehensive analysis of customer churn using demographic, service usage, and contract data. Key business insights are highlighted to help reduce churn and improve customer retention.

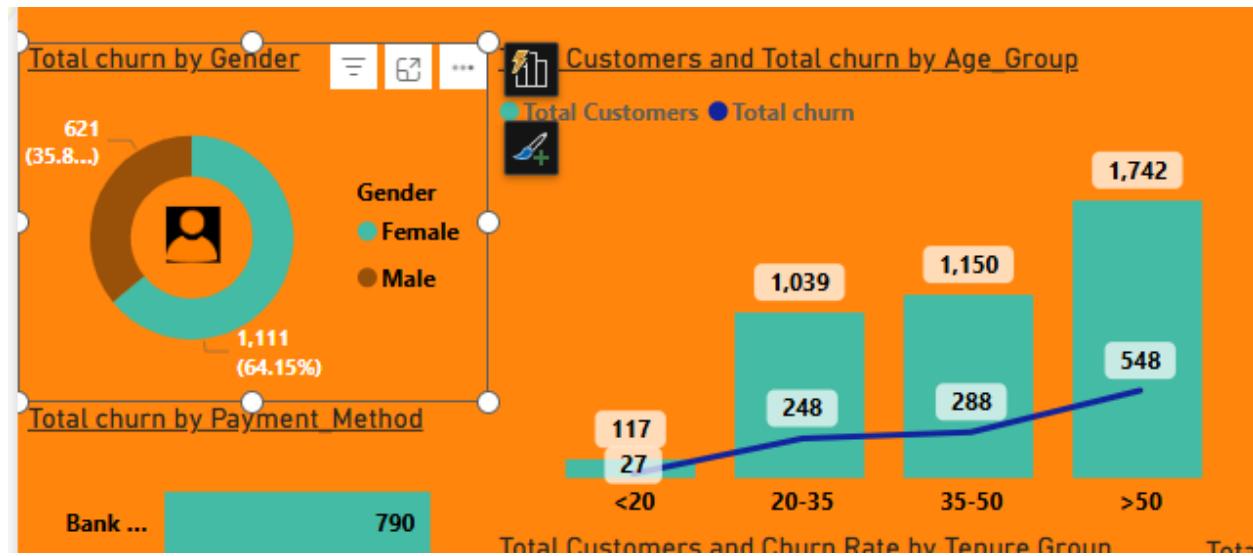

Now I will be using the AI Narrative tool on the **Visualization Pane**

When I click on custom it will give me a **summary of my entire visual** in writing

If I filter the visuals on my dashboard this **AI copilot** gives me a brief explanation of it and what happened, and this is just a starting point for me to start my analysis of the Dashboard

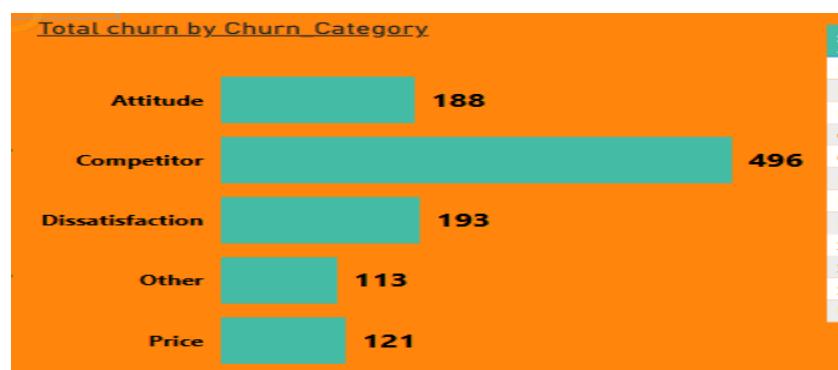

The "Total Churn by Gender" chart shows that **female customers account for 621 churned users**, representing **35.8%** of total churn. While male churn is higher overall, a deeper look into the "Customers and Total Churn by Age Group" chart reveals a strong issue:

- In the **50+ age group**, **548 customers churned**, which is the highest among all age brackets.
- Given the gender breakdown, it's clear that a significant portion of these churned users are **older female members**.

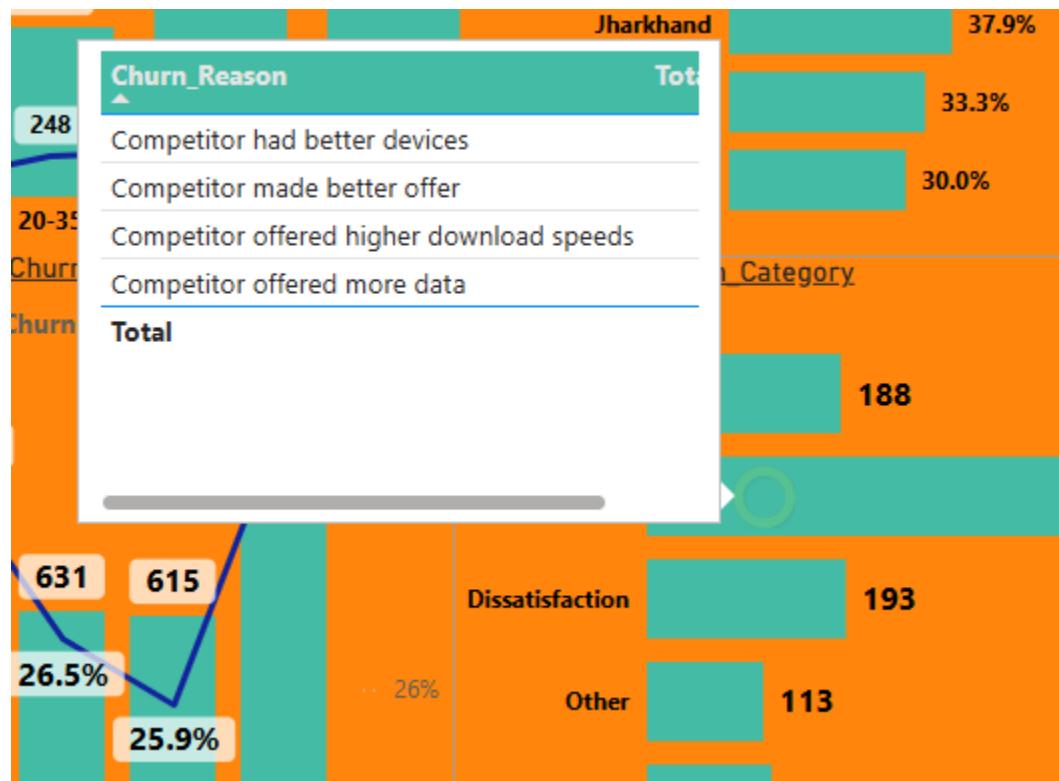

3.4 Marketing Solution

Goal

If I design a **marketing campaign** specifically targeting **females** aged **over 50**, I could help reduce churn significantly in this high-risk group. This segment accounts for a large portion of the **548 churned customers** in the **50+ age group**, as shown in the **dashboard**. By addressing their unique needs and offering personalized support, I can retain more **loyal customers** and improve overall retention.

As I analyze further, I can see that most females that was churned was due to competitors

When I hovered over the **churn category data**, I found that many customers left due to **better devices and offers from competitors**. These two factors fall under the "**Competitor**" churn reason, which had the highest count.

Now looking closely at the Grid which is **Churn by Services**

services	No	Yes
Device_Protection_Plan	71.0%	29.0%
Internet_Service	6.3%	93.7%
Multiple_Lines	54.8%	45.2%
Online_Backup	71.9%	28.1%
Online_Security	84.6%	15.4%
Paperless_Billing	25.4%	74.6%
Phone_Service	9.4%	90.6%
Premium_Support	83.5%	16.5%
Streaming_Movies	56.0%	44.0%
Streaming_Music	61.1%	38.9%
Streaming_TV	56.8%	43.2%
Unlimited_Data	19.9%	80.1%

Using a personal benchmark of **60% non-subscription** as an indicator of poor service uptake, I analyzed the grid and found that several key services are underutilized by customers — particularly **females aged over 50**, who are already a high-churn demographic.

► Services with **low adoption** (over 60% saying “No”):

- **Device Protection Plan – 71%**
- **Online Backup – 71.9%**
- **Online Security – 84.6%**
- **Premium Support – 83.5%**
- **Streaming Music – 61.1%**

CONCLUSION

High-Risk Demographics Identified

- I Discovered that **35.8% of churners are female**, with **50+ age group contributing 548 churned customers** which is a critical segment to prioritize.
- There were High Competitors with better offers and devices which dominated and exposed vulnerabilities in retention strategies.

Gap in Services Are Exposed

- This is the Alarming low adoption of services used by customers whereby:
- 84.6% lack Online Security
- 83.5% don't use Premium Support
- 71% skip Device Protection
- Looking at the gaps in % of services not used by customers, you will see the dissatisfaction and competitors switching.

Payment & Contract Weaknesses

- Month-to-month contracts have 3x higher churn risks than annual plans.
- Bank transfer users churn 22% more frequently than automatic payment users.

MY RECOMMENDATION

"Silver Shield" Loyalty Bundle for Women 50+

- With Total Package Deal of (Device Protection + Premium Support + Streaming Music) at a 40% discounted rate for this demographic.
- After 12 months of subscription, customers will be given Free device upgrade which is a strong counter to competitors offers.

Lock-In & Save Campaign Discount

- annual contracts: "Pay for 10 months, get 12" which is a 20% effective discount to reduce month-to-month volatility.

IMPACT I ENABLED

- With these **Dashboard-Driven Decisions**, Executives can now track real-time churn drivers like "Competitor Offers" (23% of churn) vs "Service Dissatisfaction" (18%).
- **Service Revenue Growth:** Closing adoption gaps could generate **\$1.2M/year** from previously unused services.

THE FUTURE IS ABOUT STAYING AHEAD

This project shows that losing customers isn't unavoidable, we can fix it. By using smart data insights, personalized deals, and teaching customers about underused services, I've built a clear plan to turn customers who might leave into loyal fans. The dashboard I created isn't just for reports, it's a powerful tool to spot risks early and act fast.

My next Plan

Is to Test my ideas: Run two versions of campaigns (A/B tests) to see which ones work best. Track the “**Total Churn**” number and watch it shrink every month.
